

The Anatomy of Stability

The physics, hardware, and algorithms that allow autonomous flight to defy gravity.

Convergence: Sub-millisecond processing
| Fluid Dynamics | Control Theory.

NATURAL STABILITY

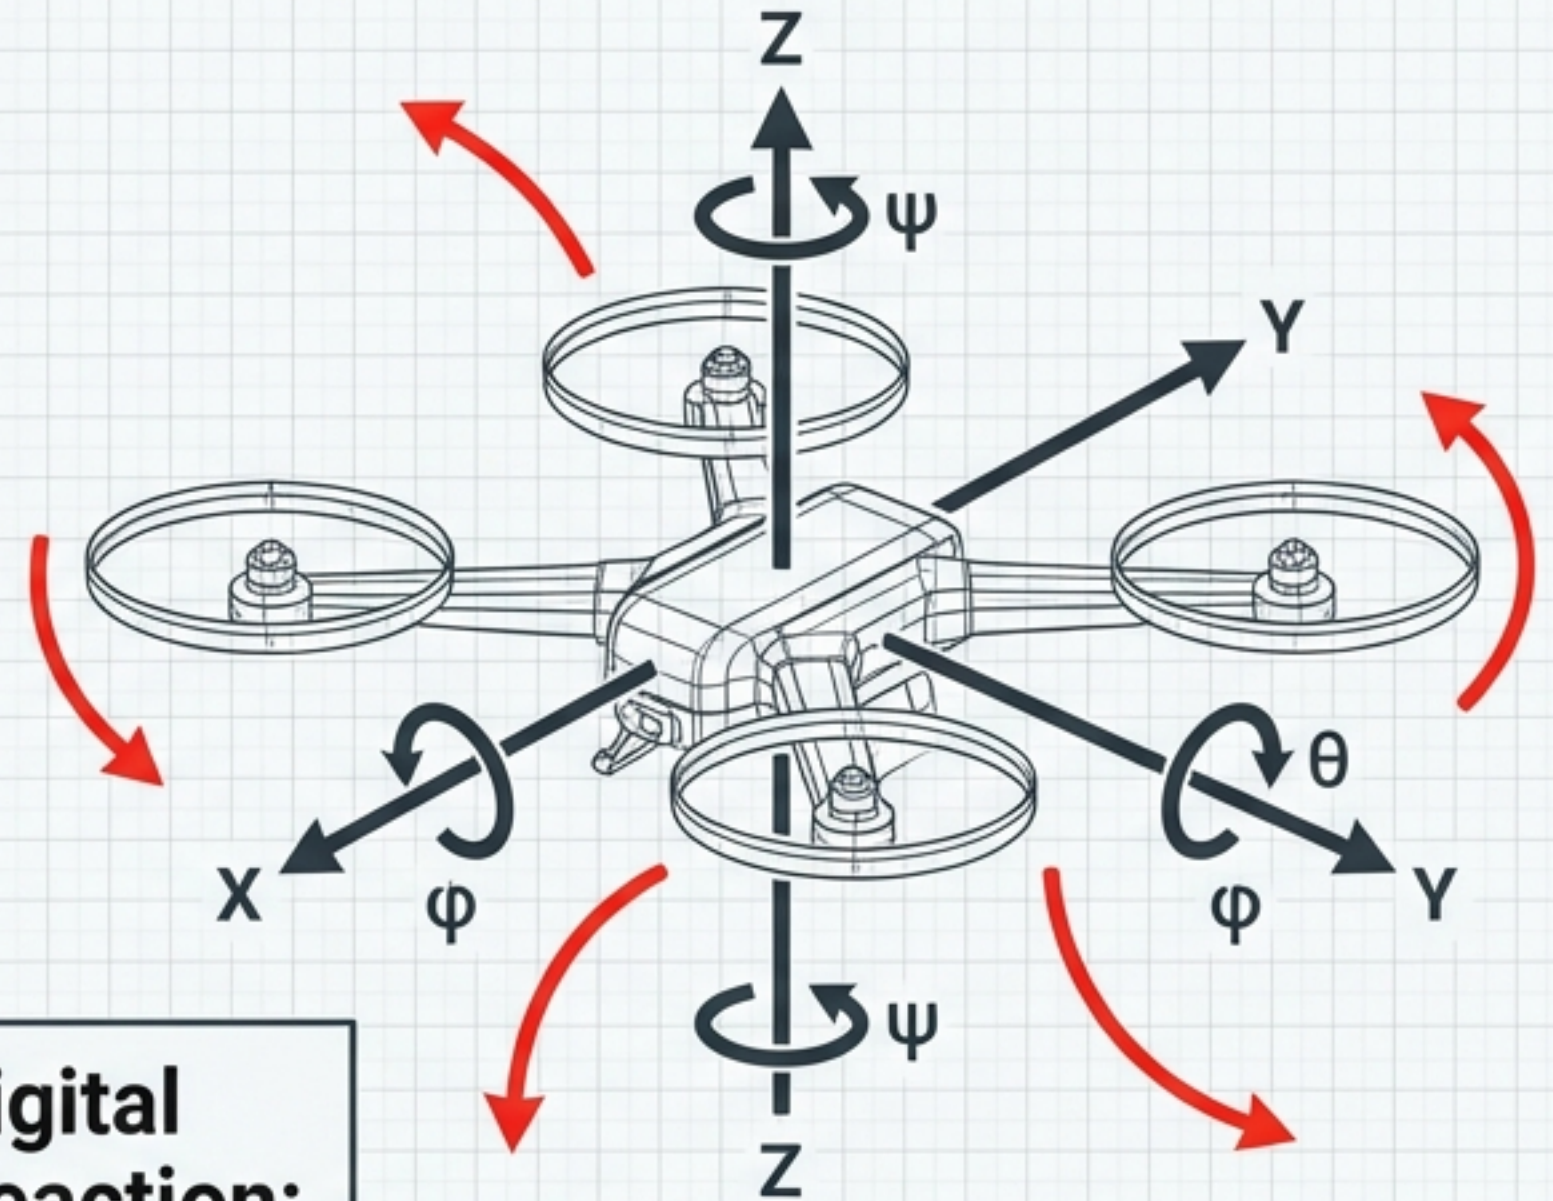

Aerodynamic forces passively balance to maintain flight path.

Human Reaction:
~200ms

Digital Reaction:
<1ms

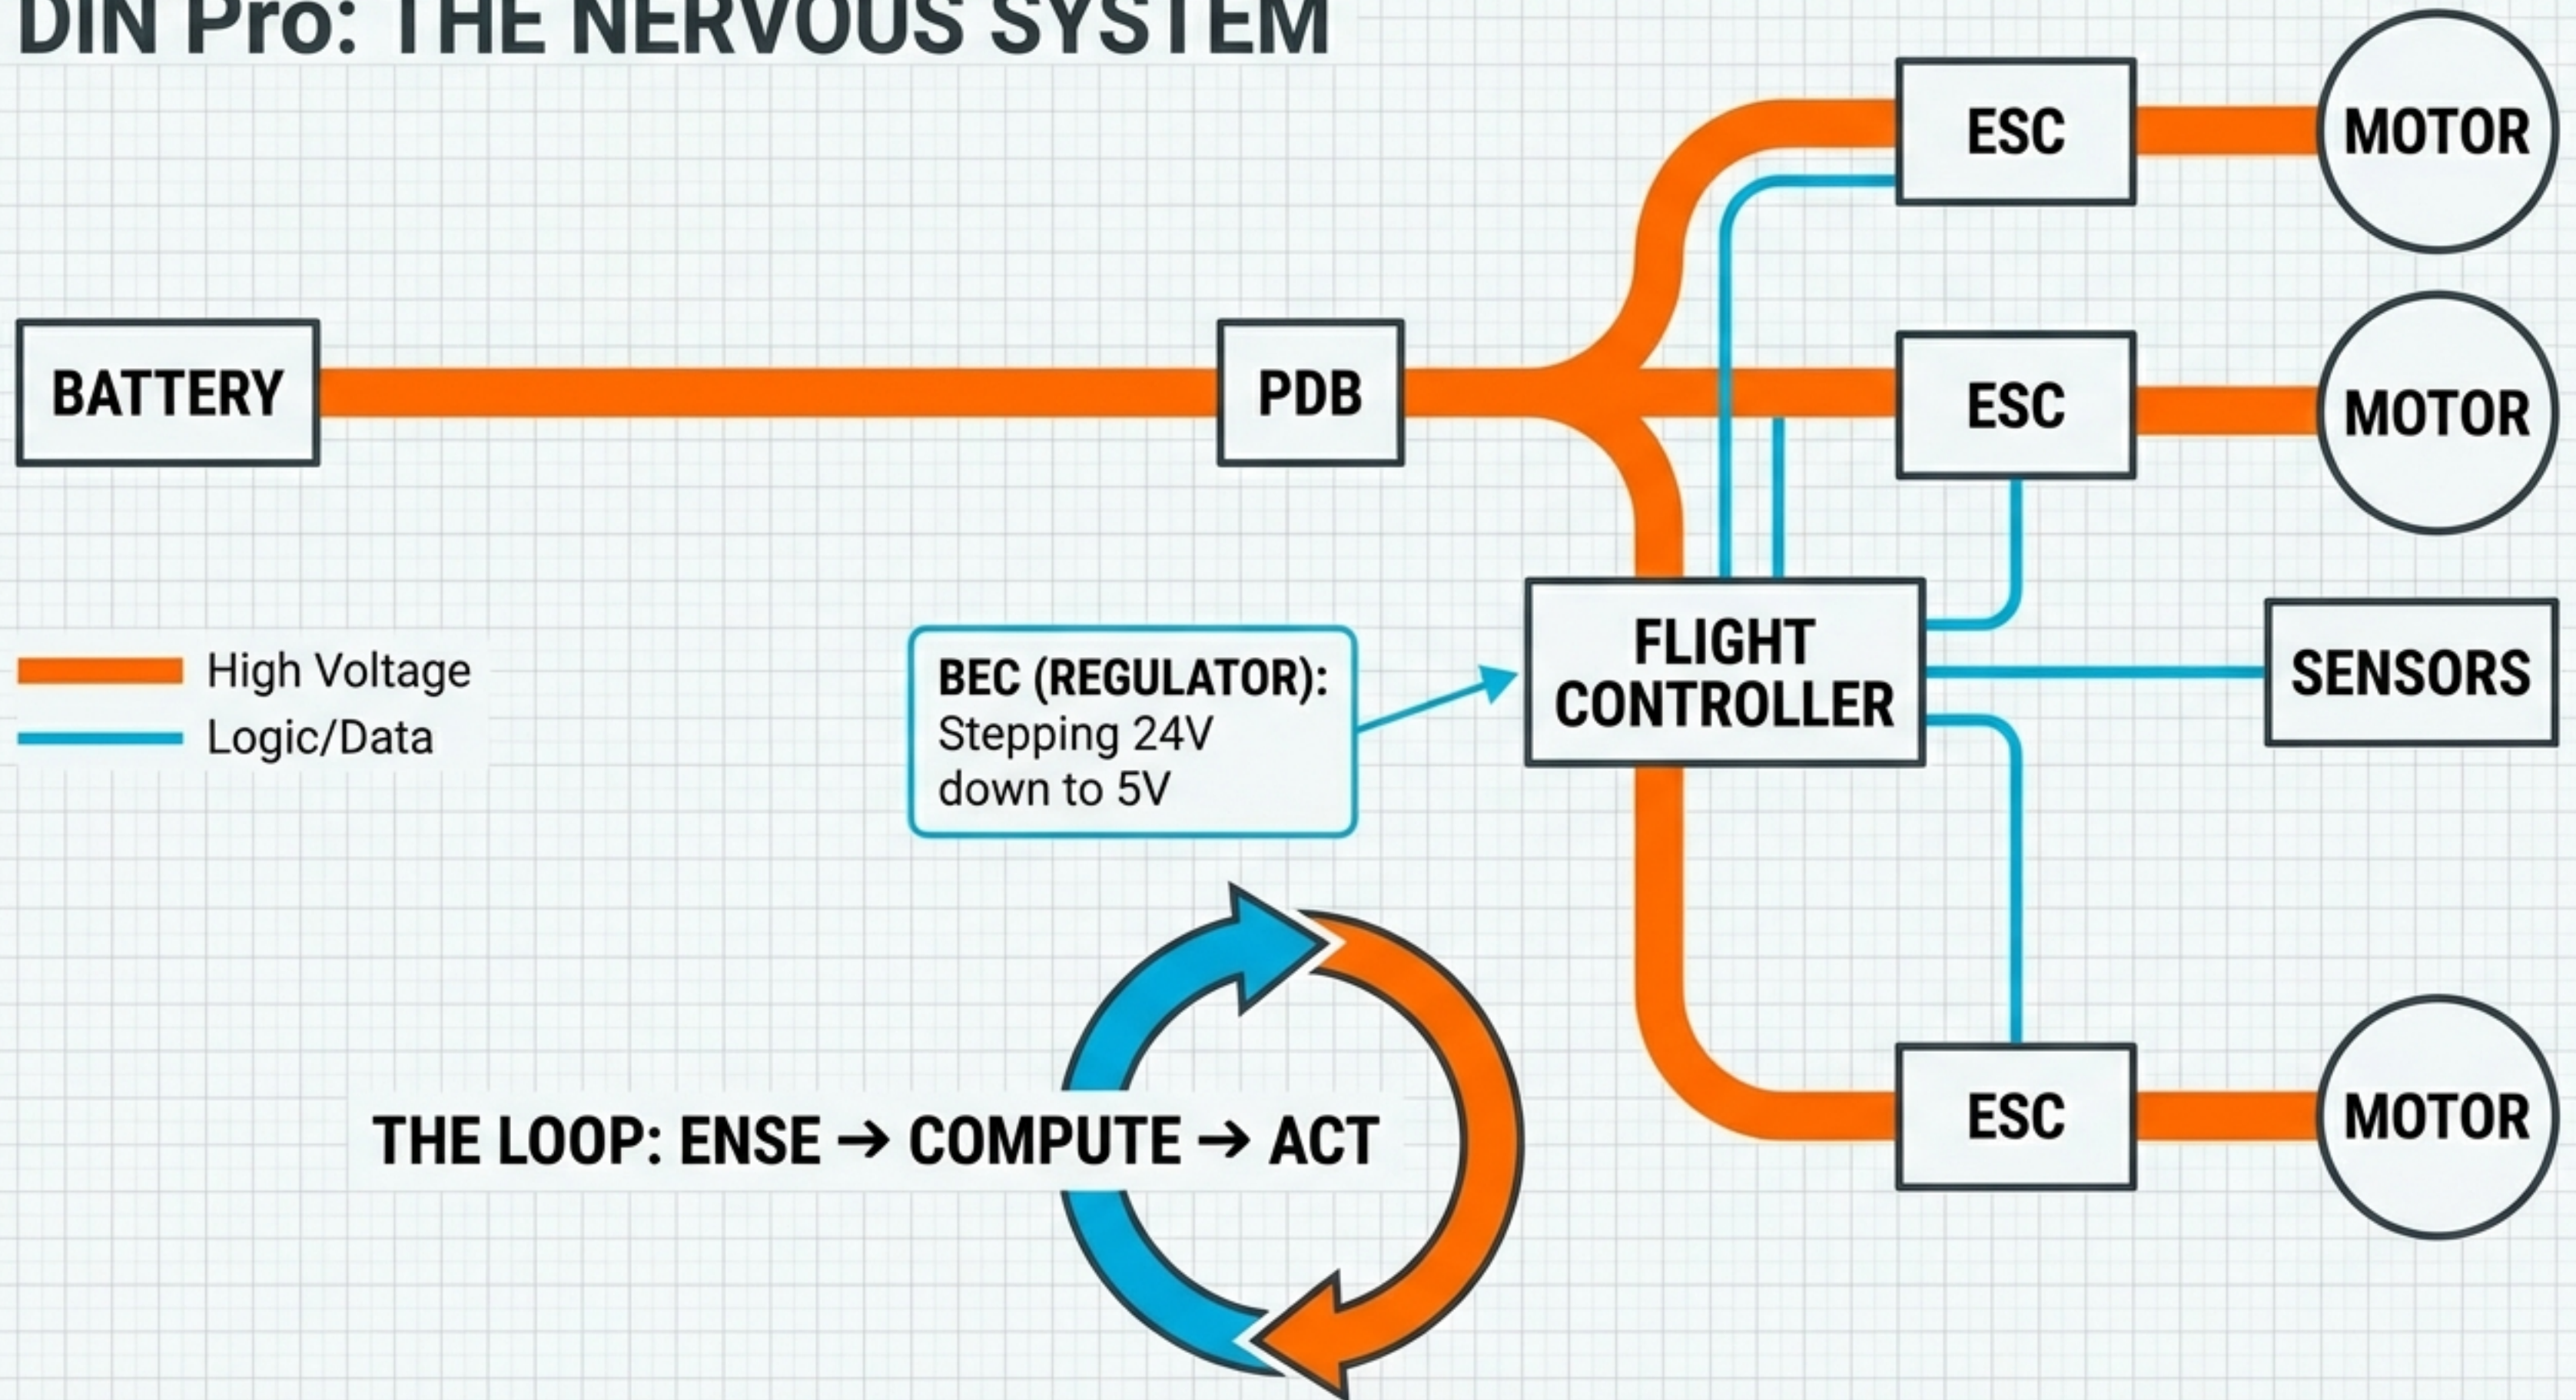

INHERENT INSTABILITY

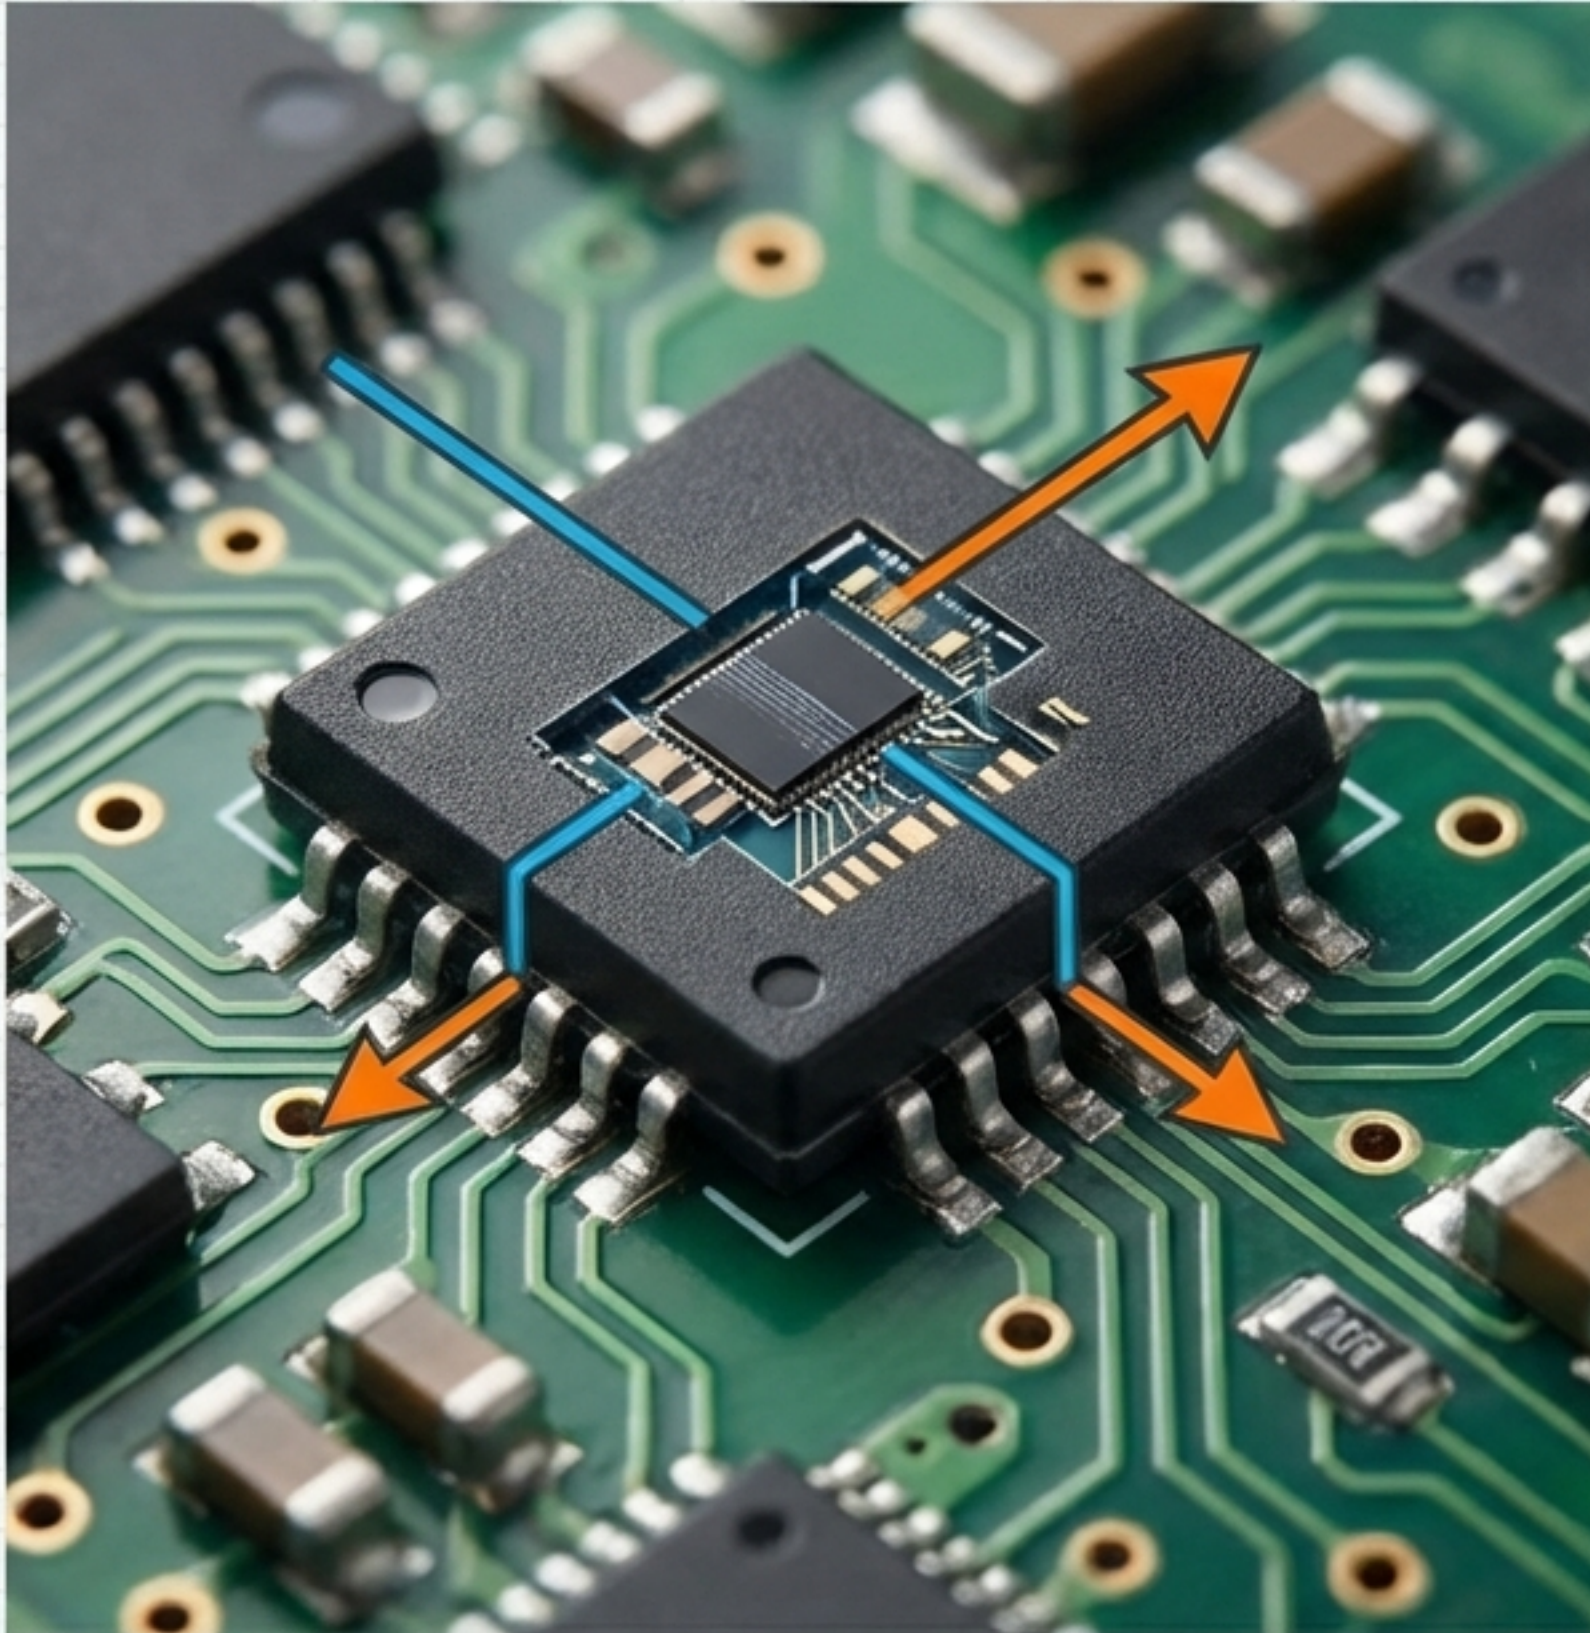

Requires continuous active corrections across all 6 axes.

Unlike a plane, a drone is a brick fighting gravity. Without active intervention, it crashes in seconds.

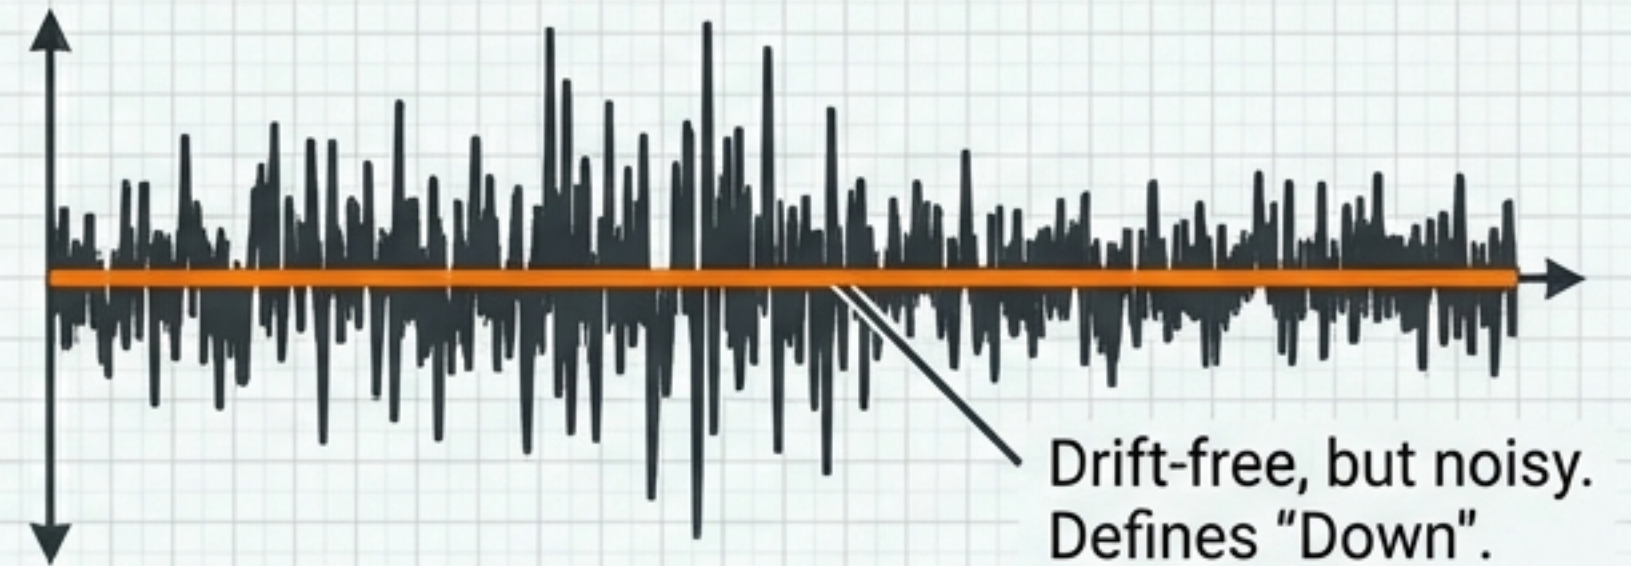

DIN Pro: THE NERVOUS SYSTEM

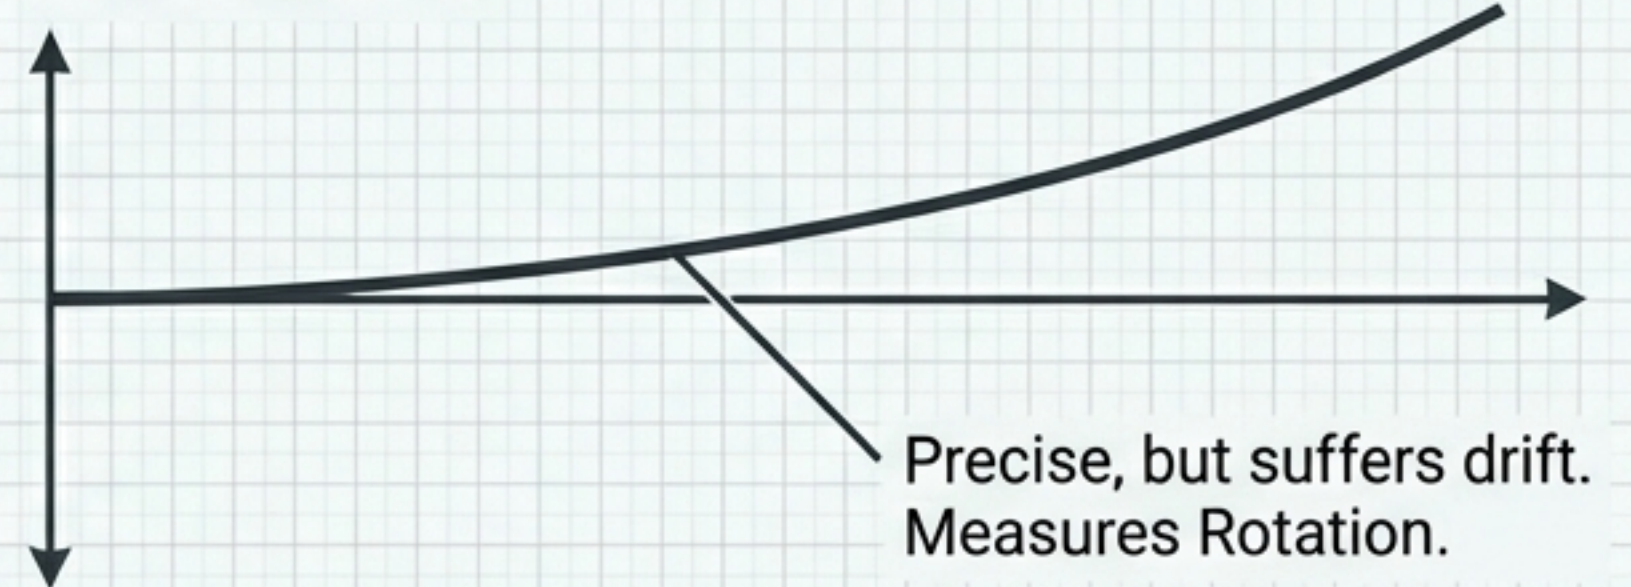

THE INNER EAR: THE IMU

ACCELEROMETER

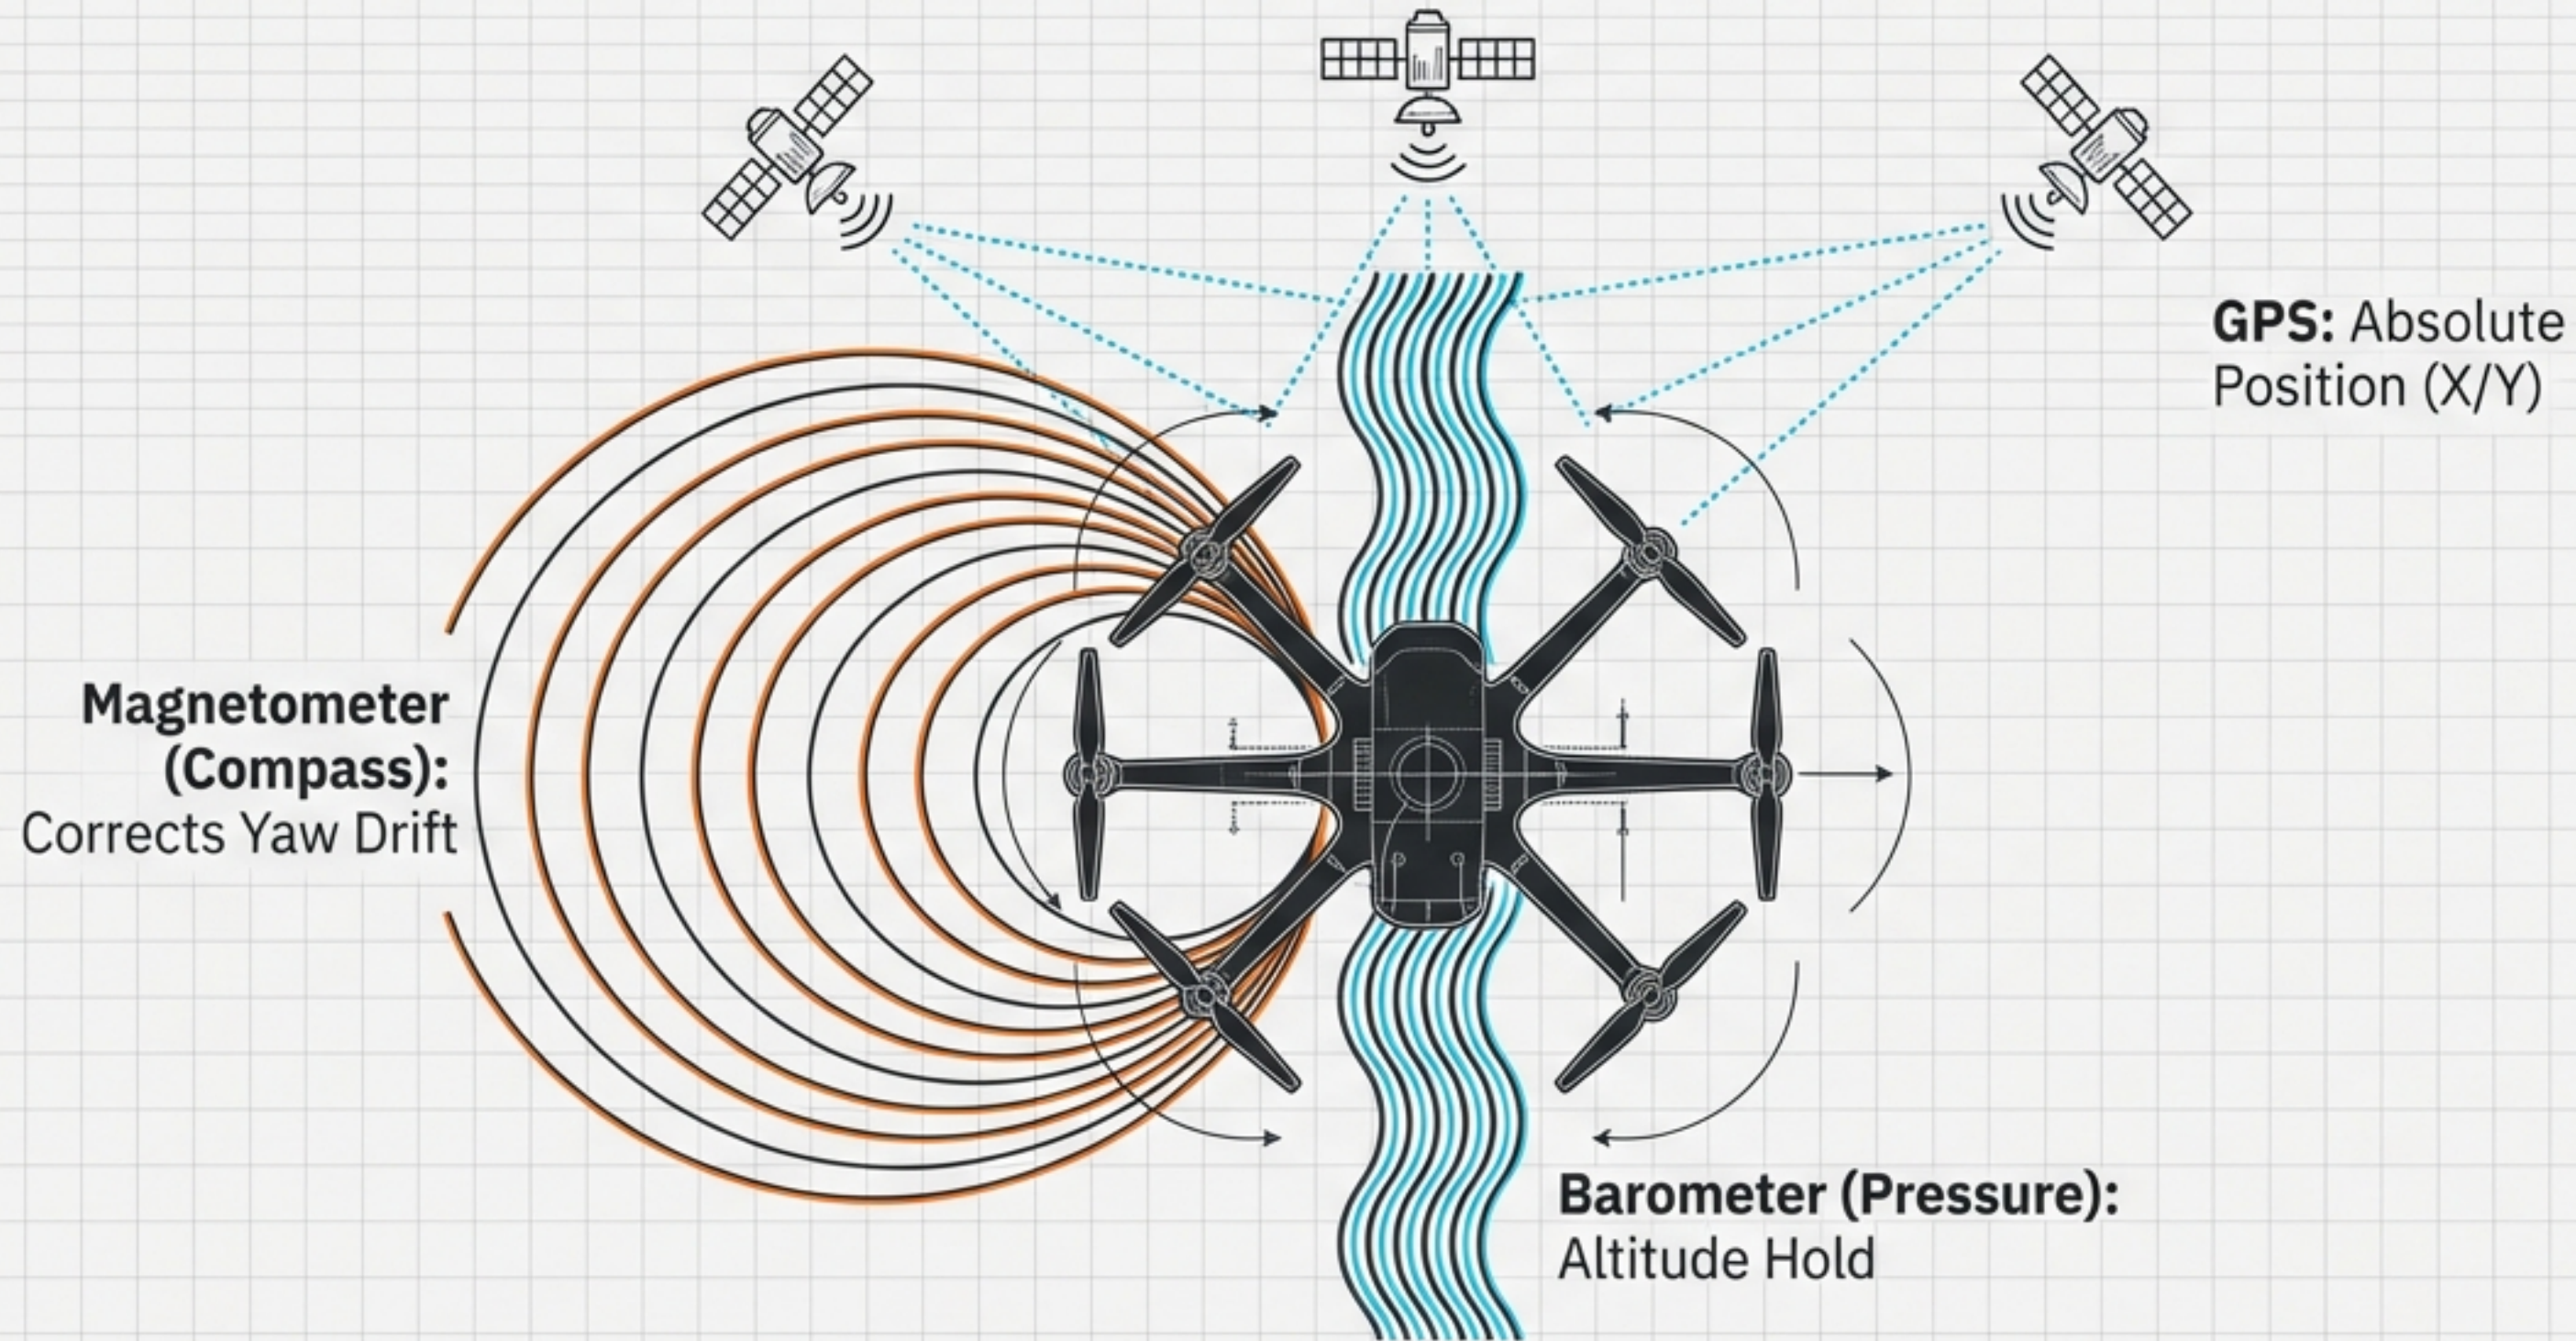

GYROSCOPE

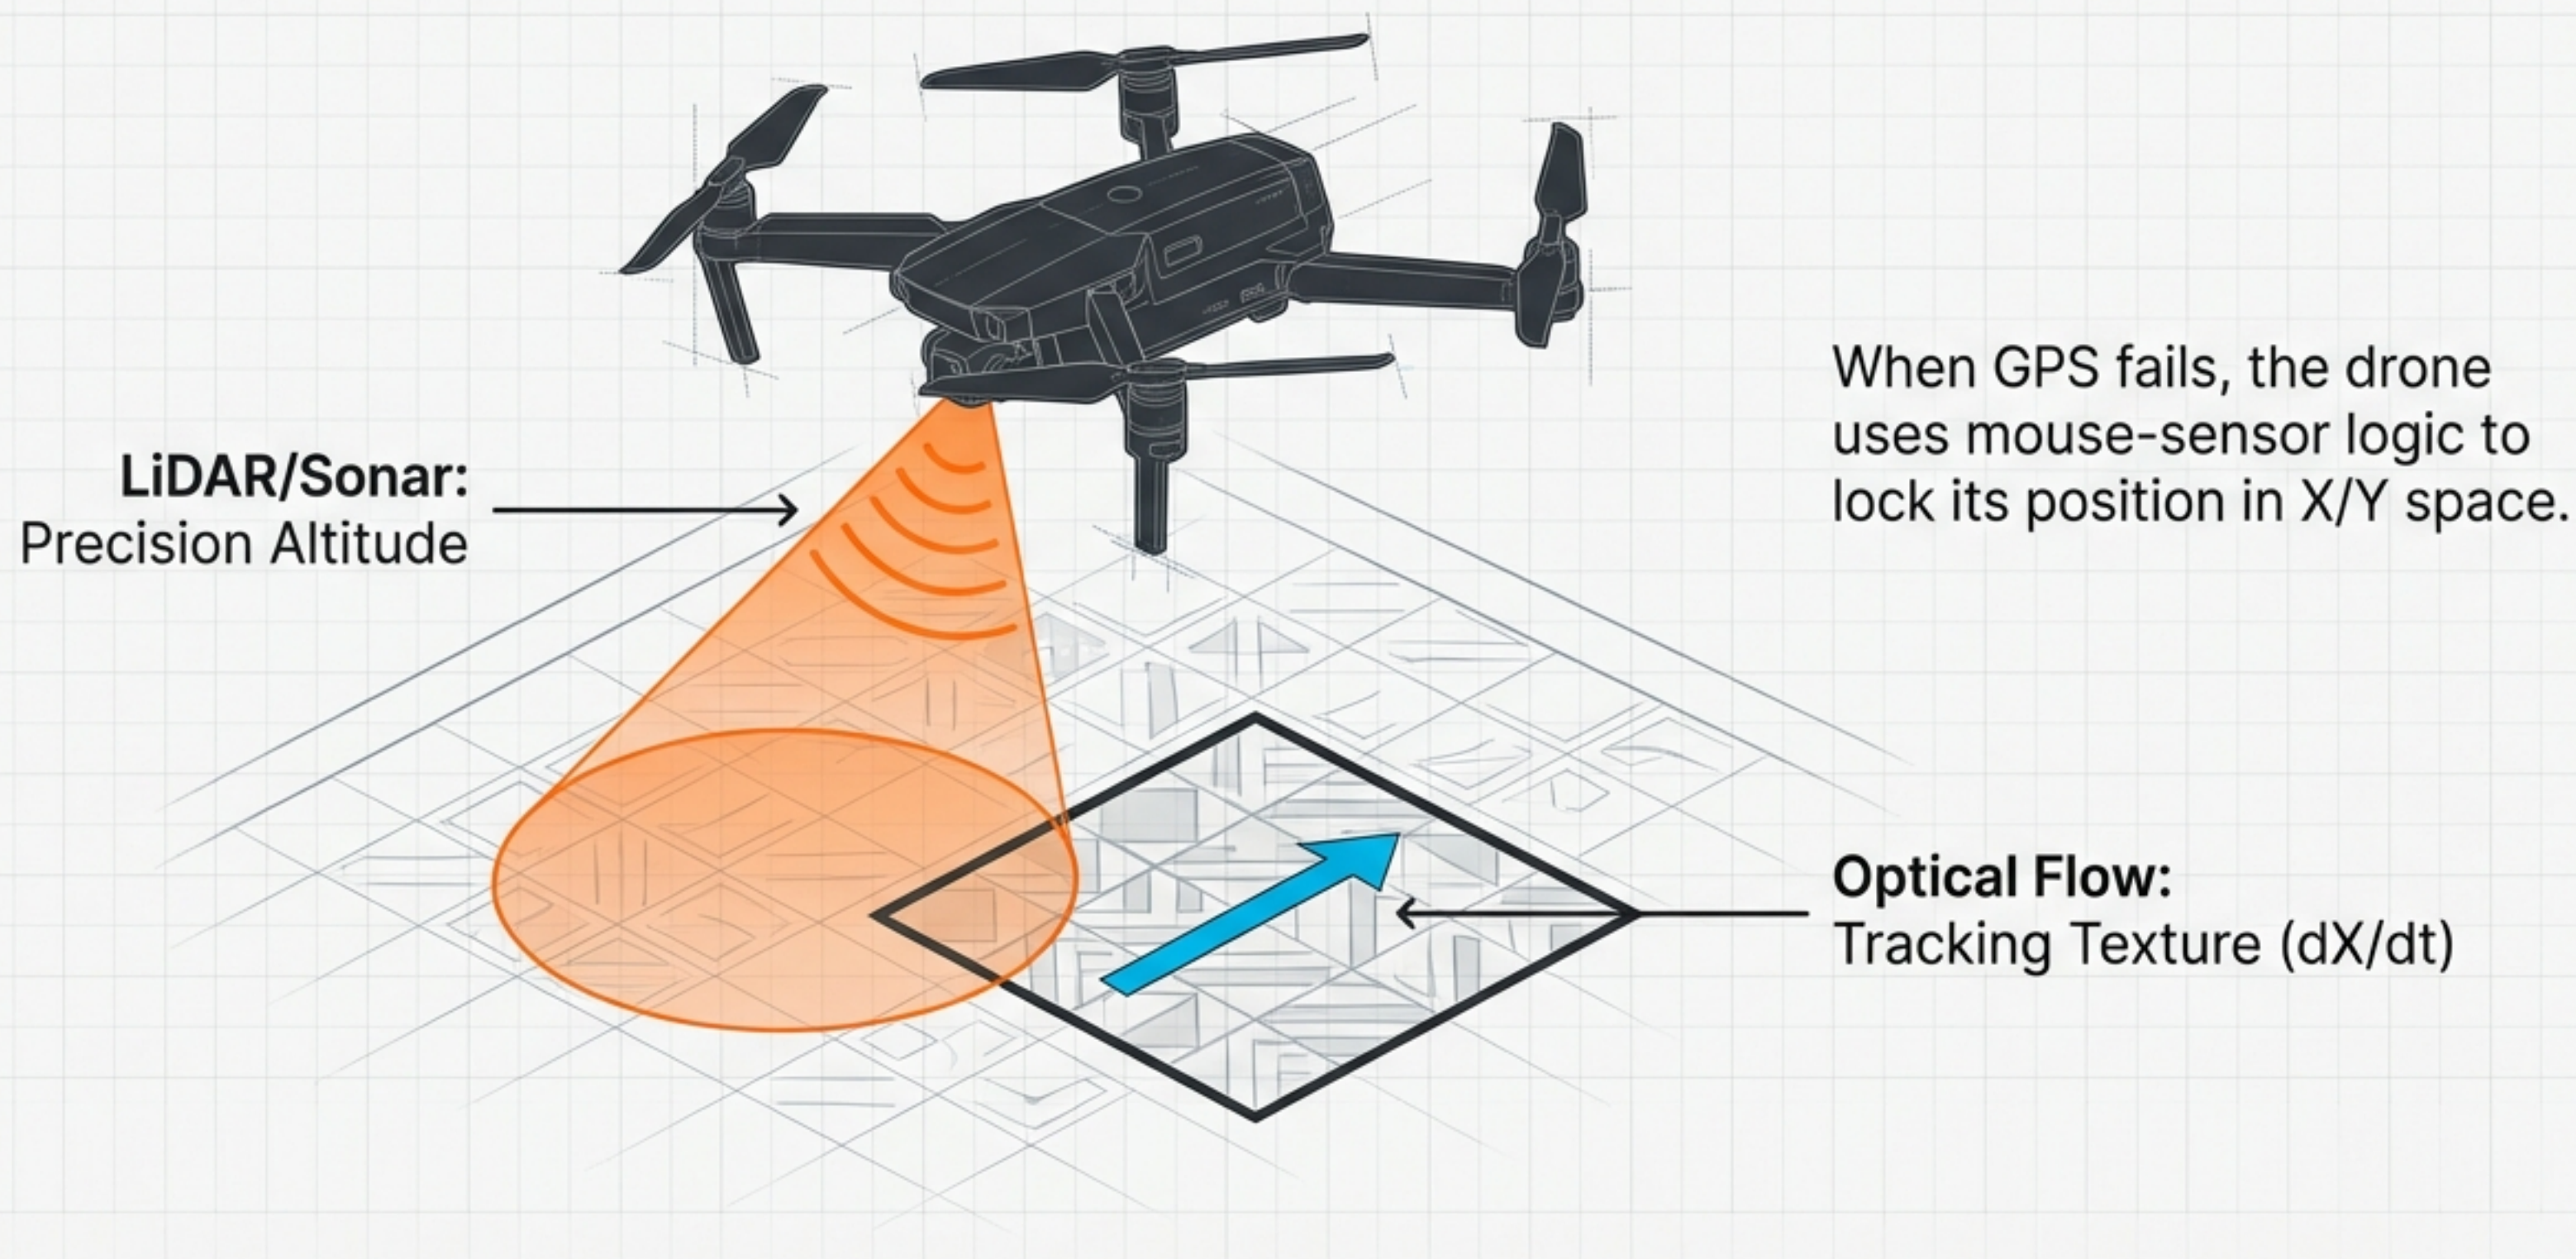

The IMU combines these to know 'Down' and 'Spin'.

Spatial Awareness

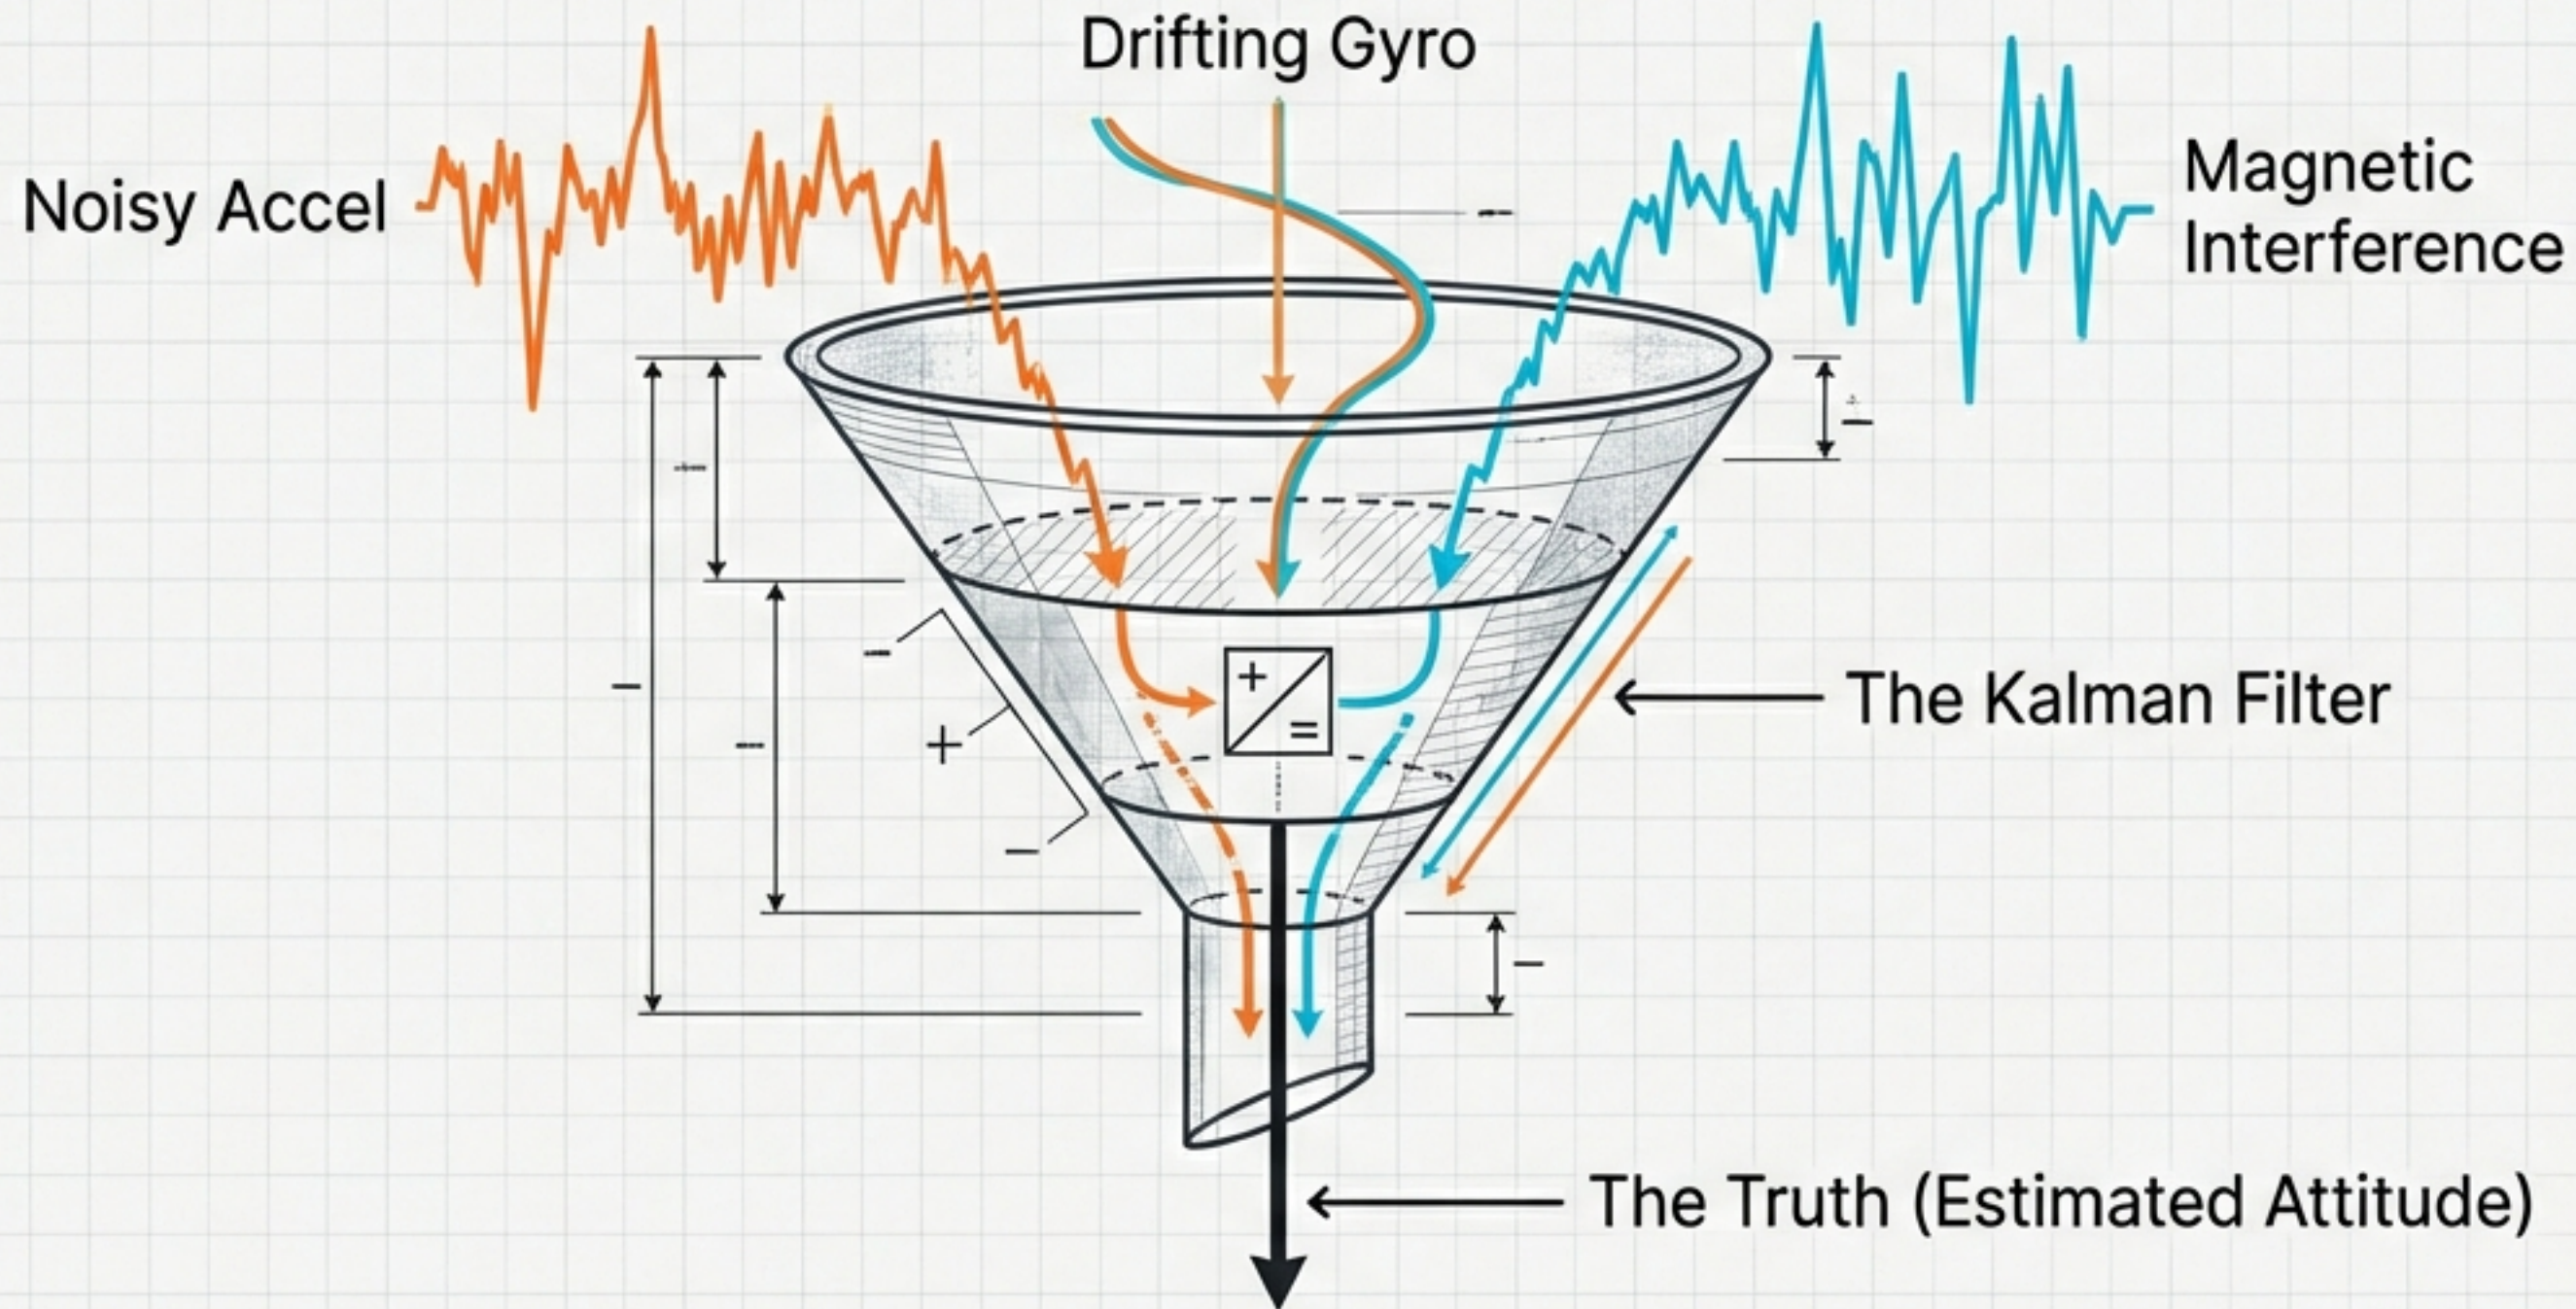

Placing the organism in the physical world

SIGHT BEYOND SATELLITES

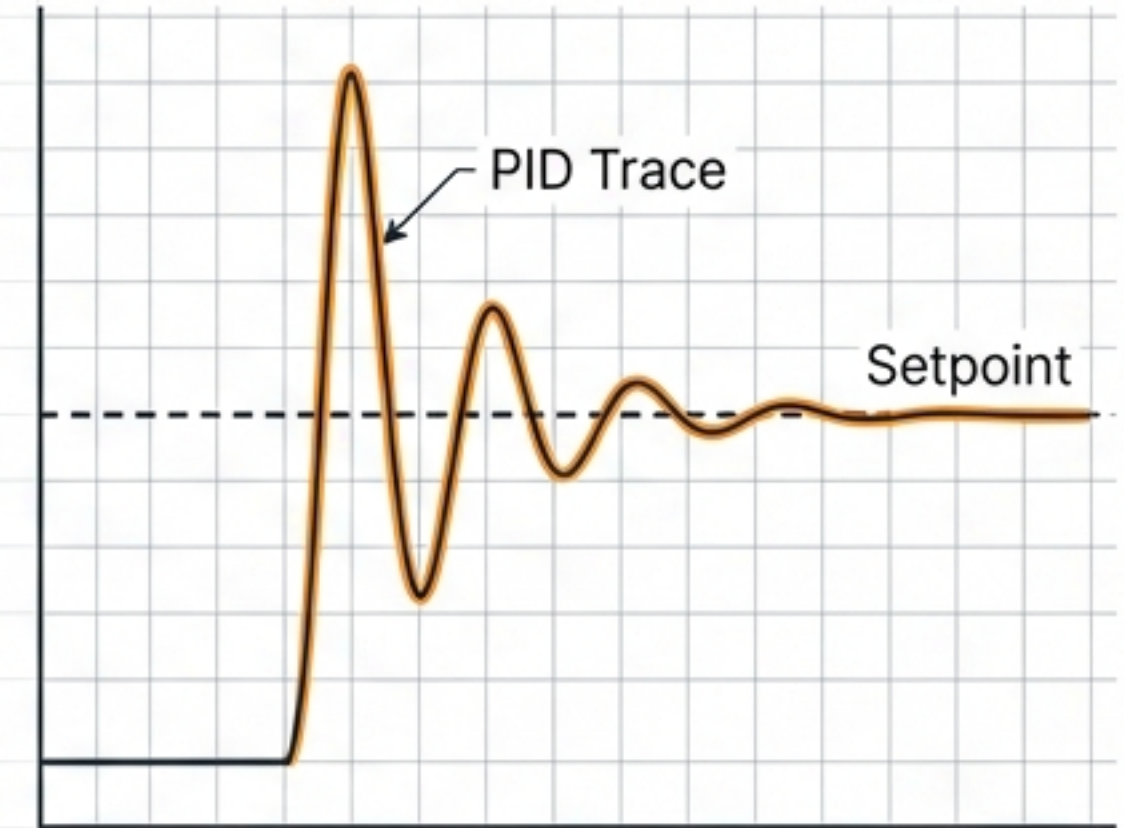

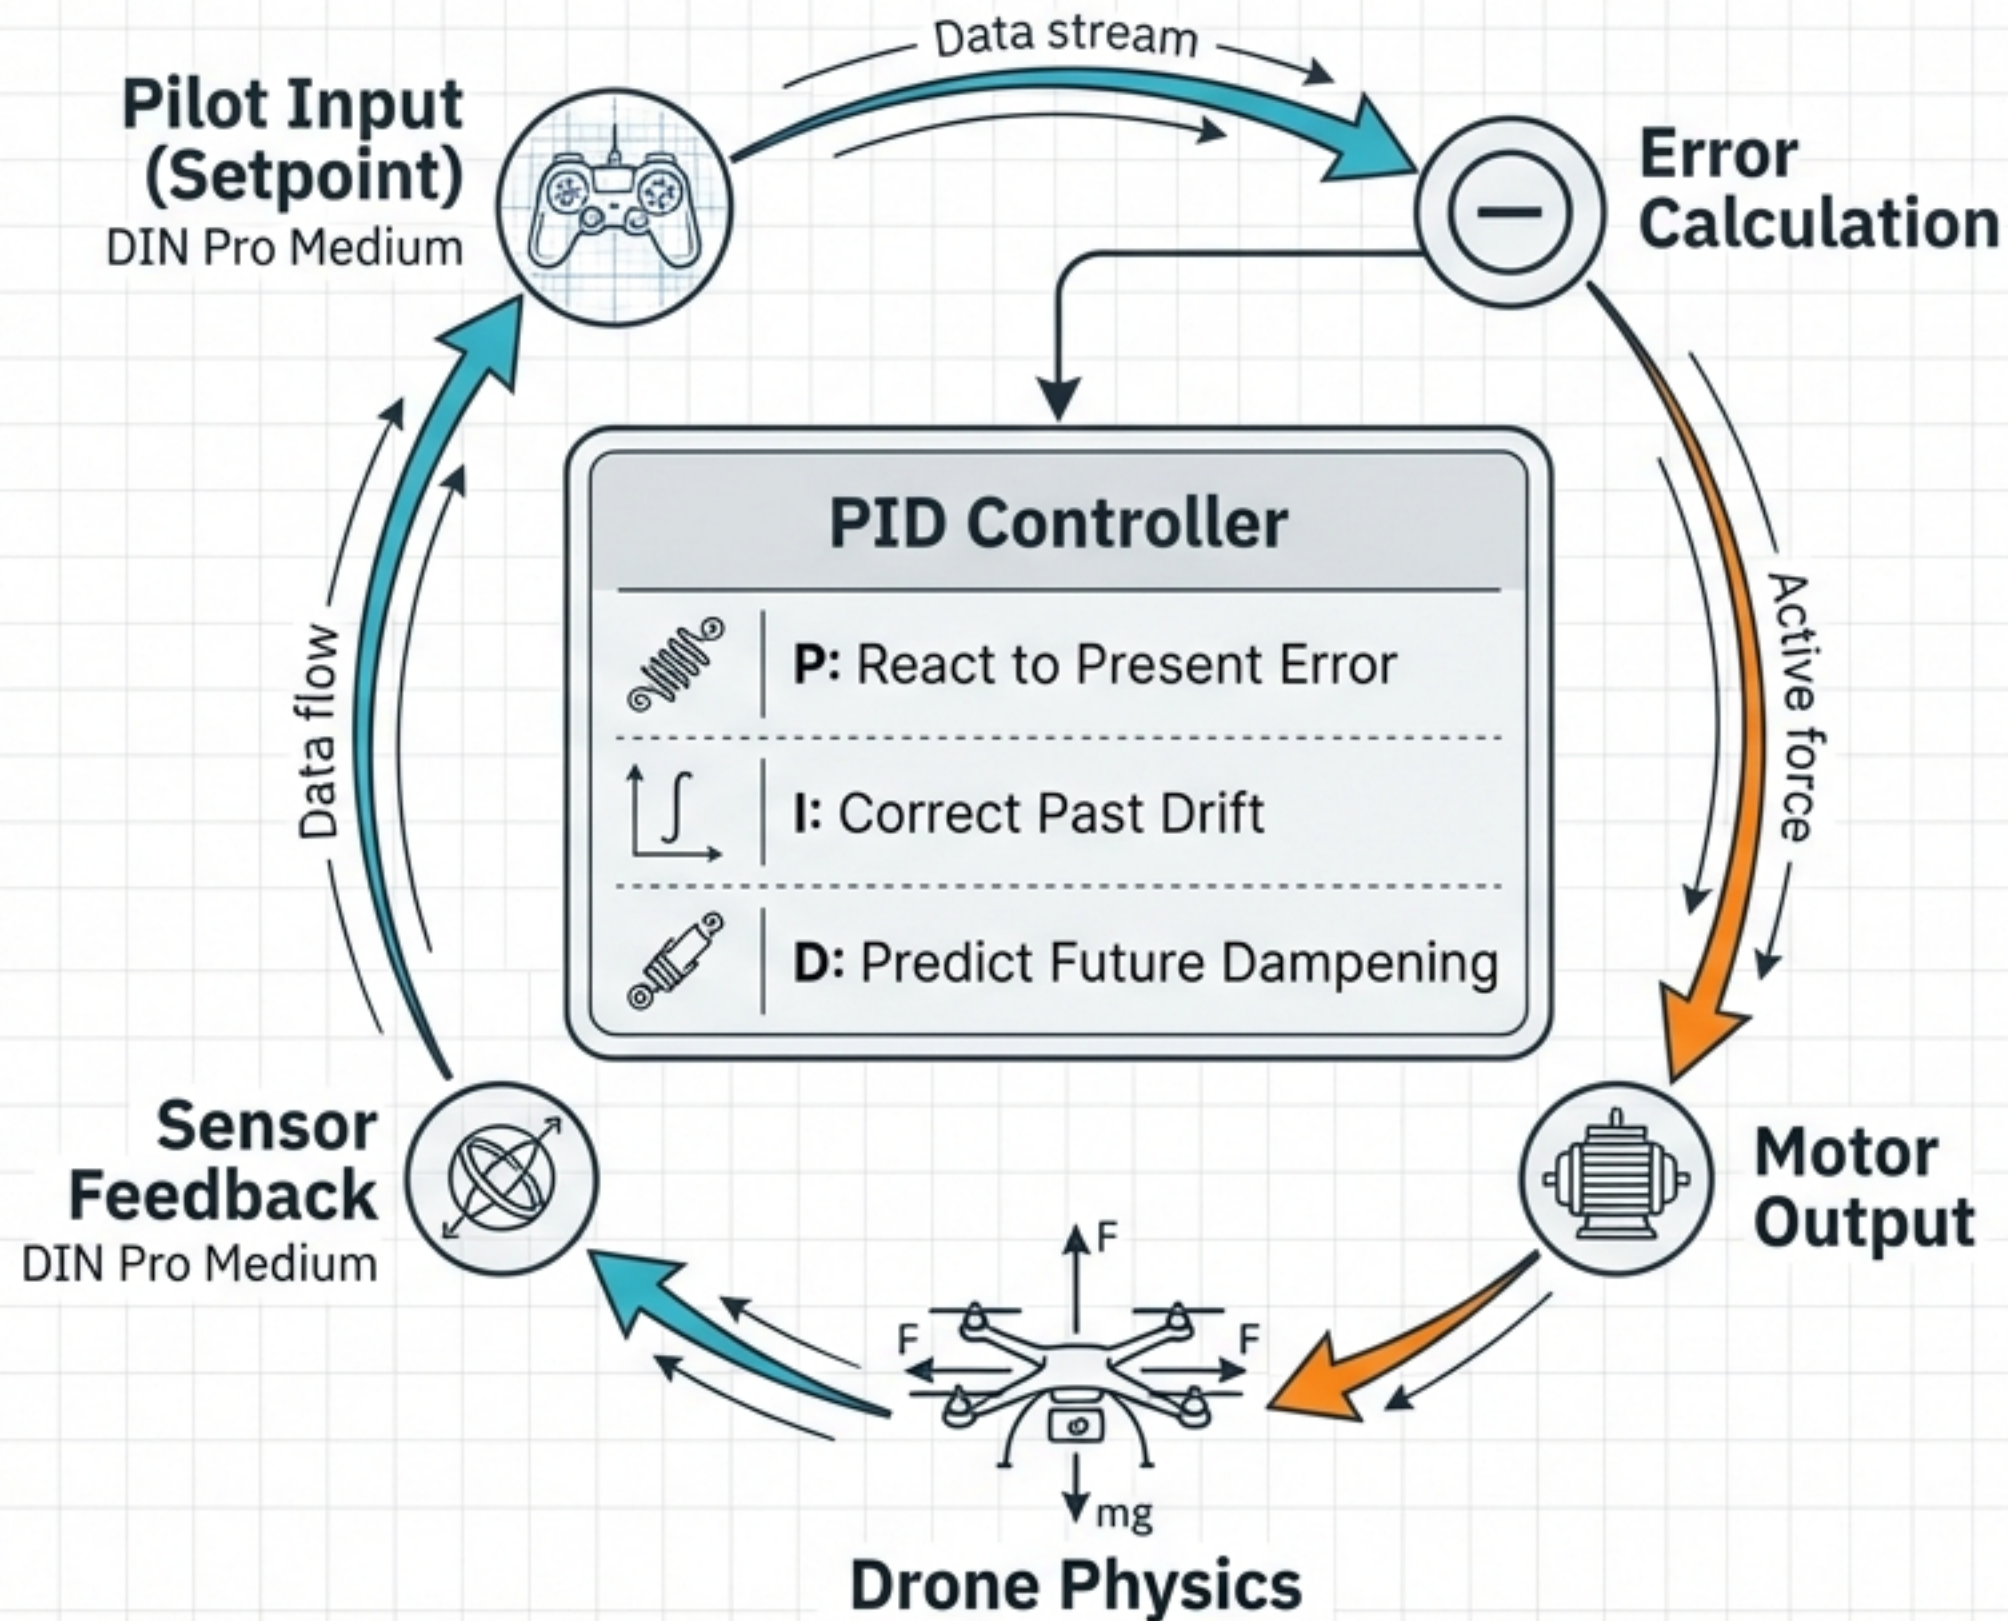

The Brain I: Sensor Fusion

Sensors lie. The brain must mathematically fuse them to find the true orientation.

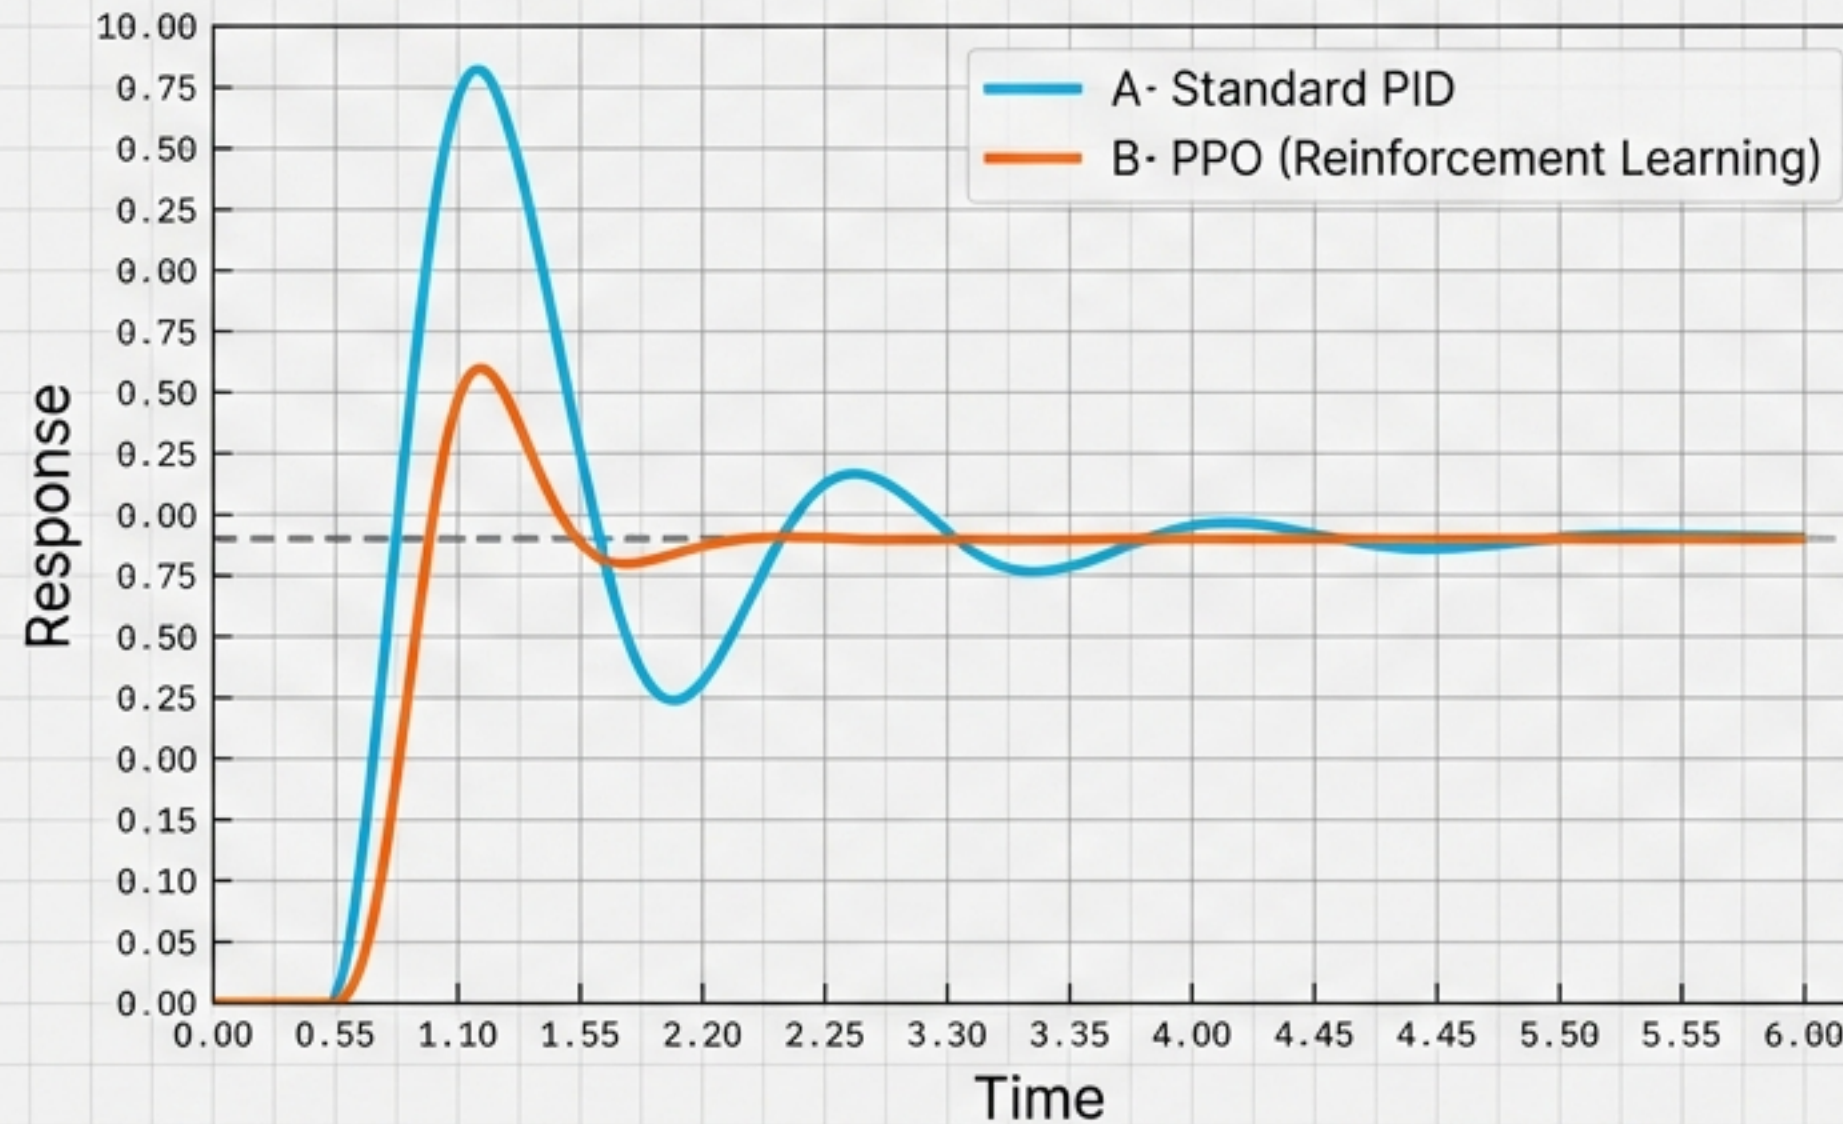

The Brain II: The PID Loop

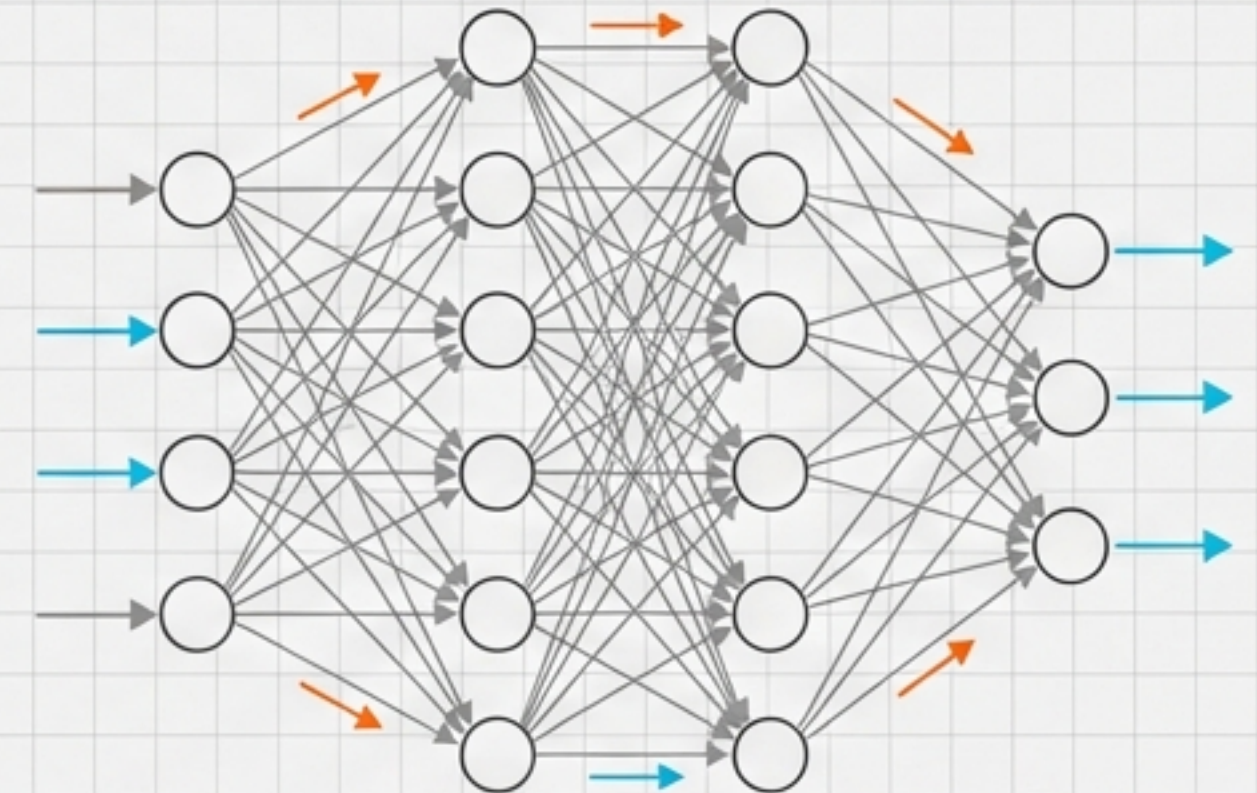

This mathematical heartbeat runs 4,000 times per second.

The Brain II: Evolution

Controller Response Comparison

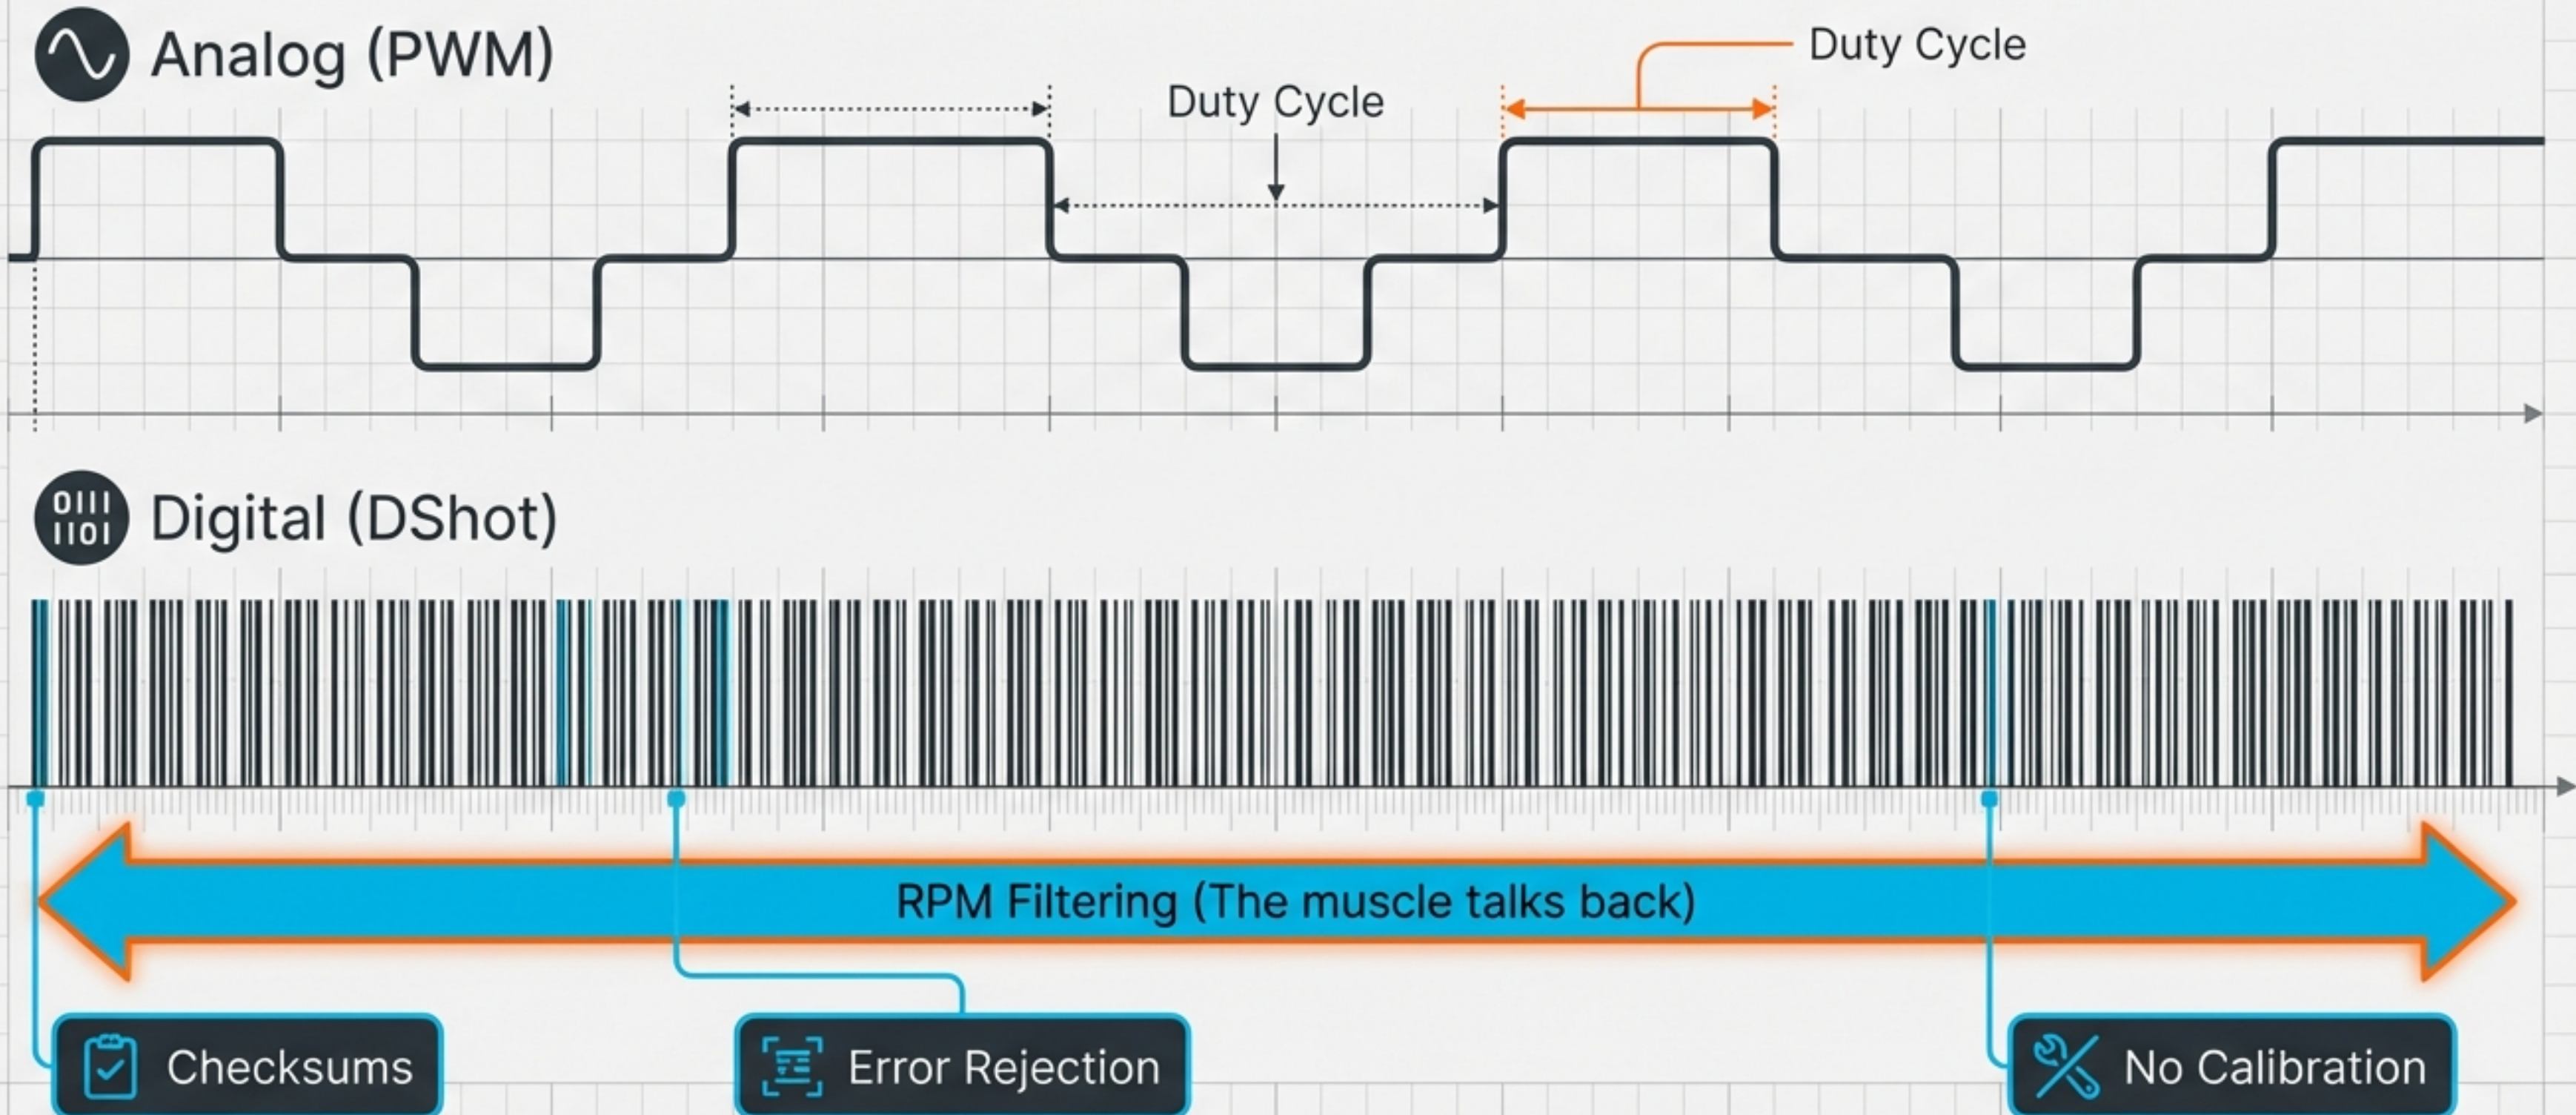

Neural Network Controller

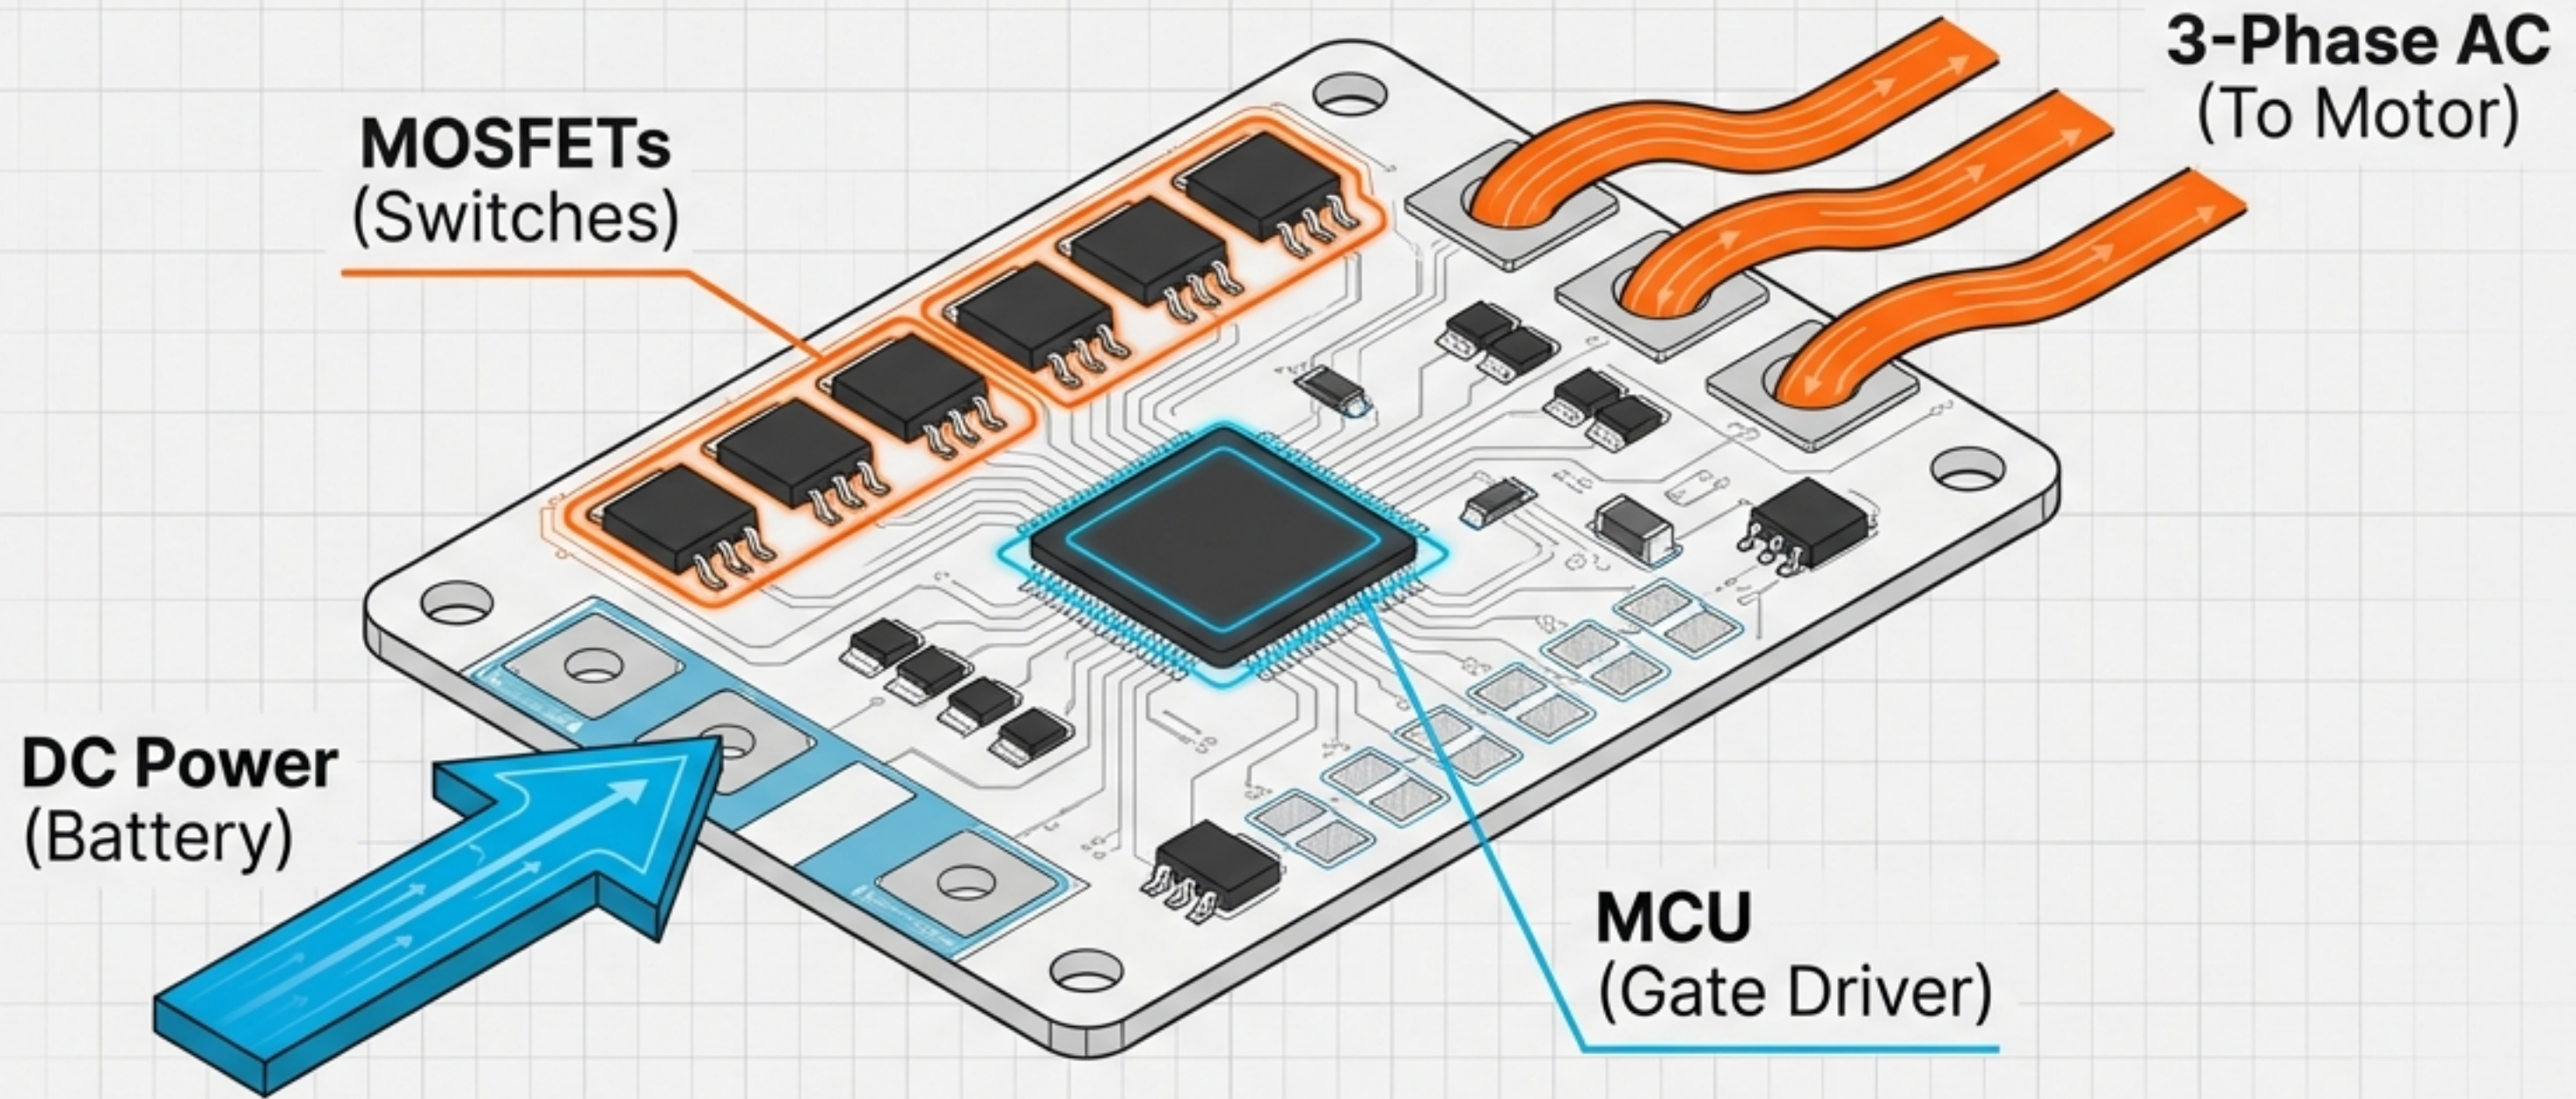

End-to-End Learning. The drone learns physics in a simulator (Digital Twin) before ever flying.

The Translator: Protocols.

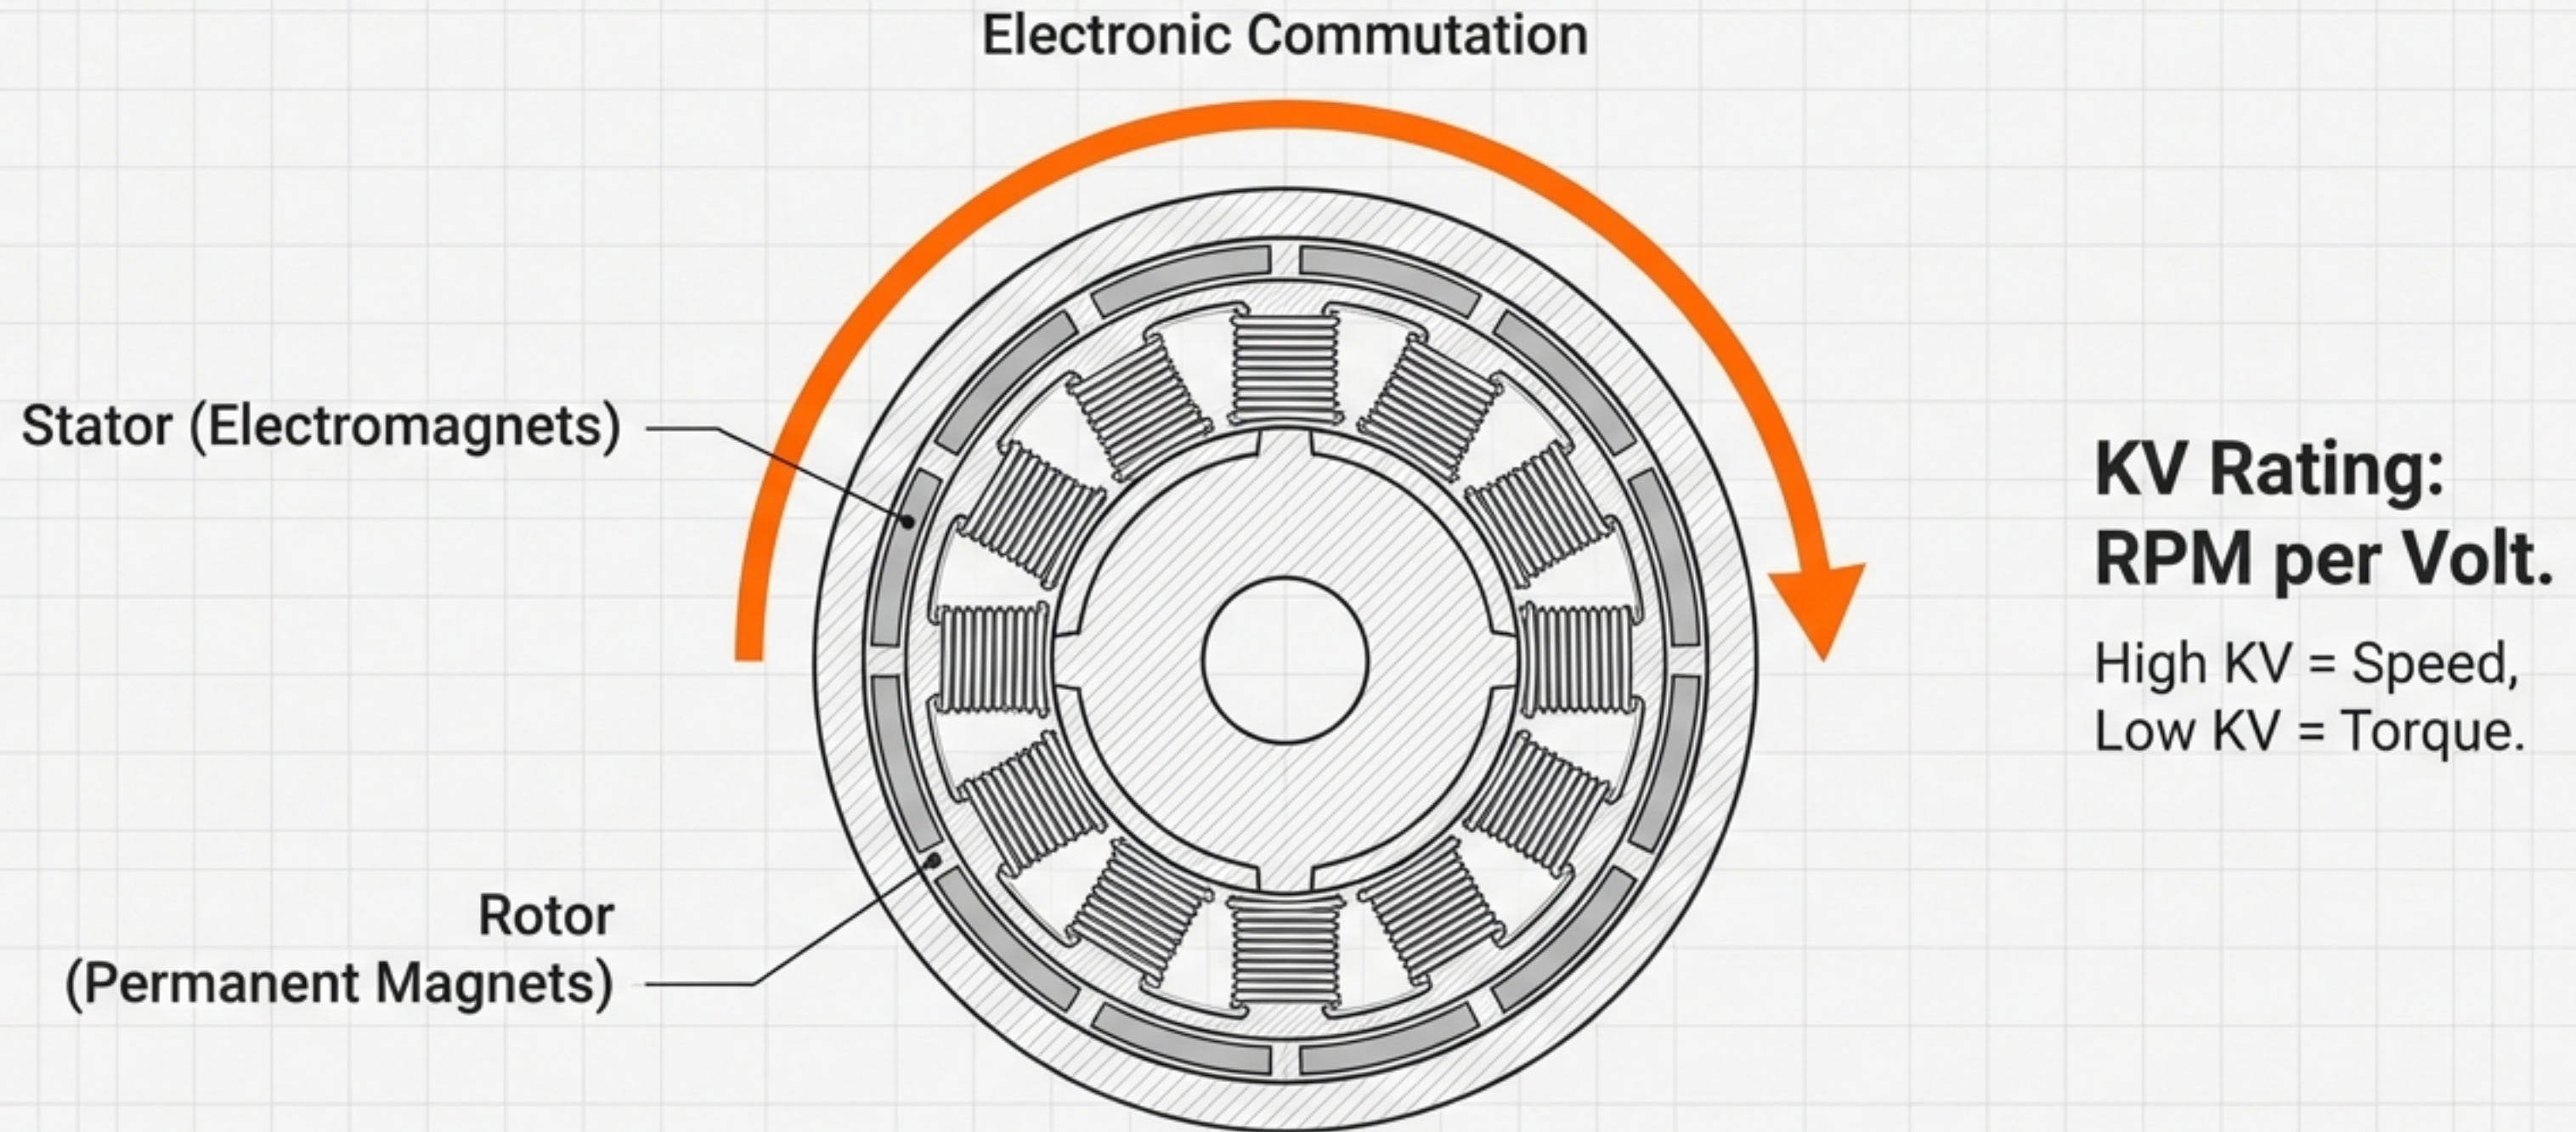

The Muscle I: ESC

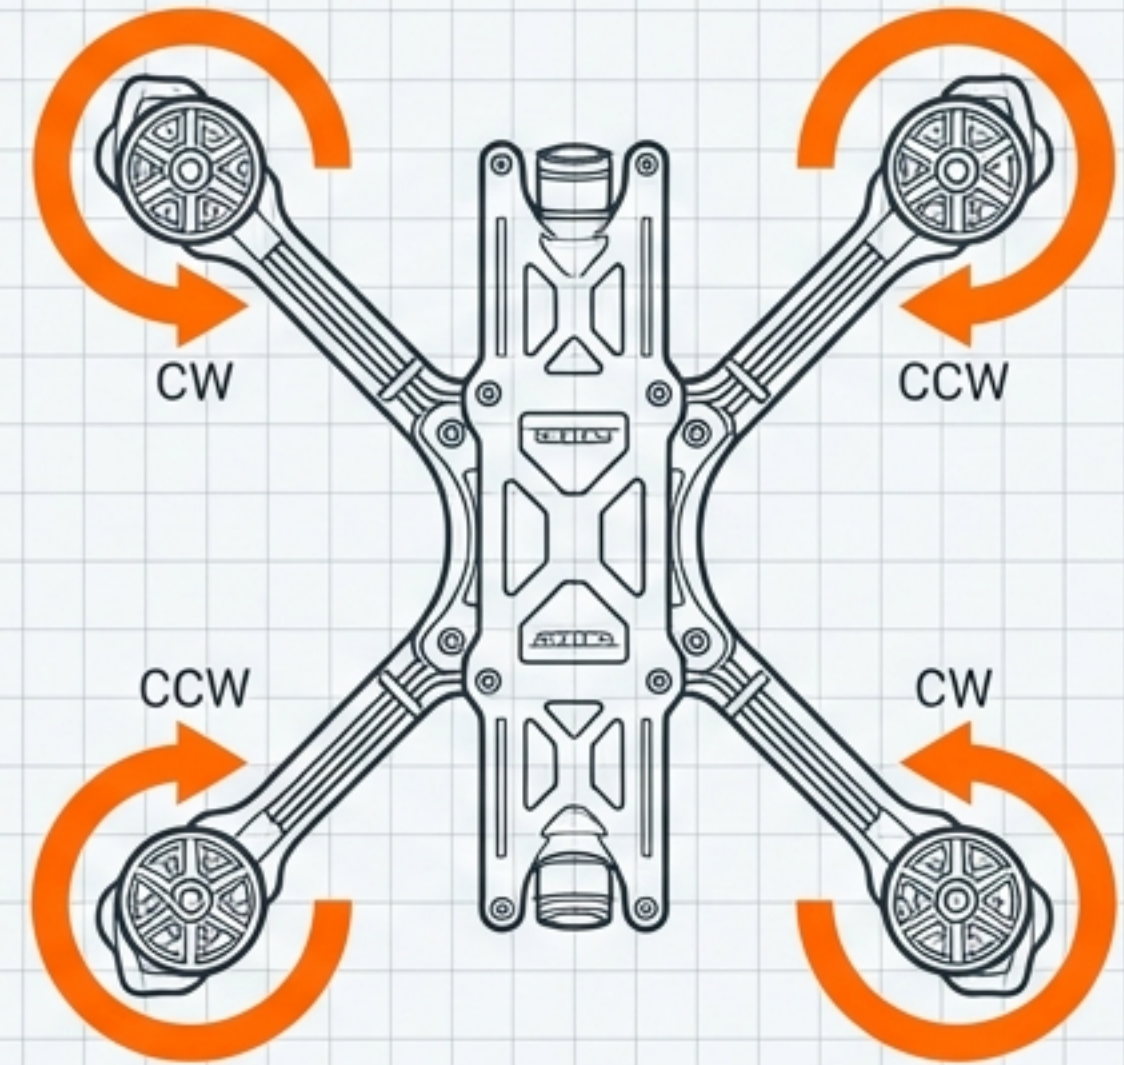

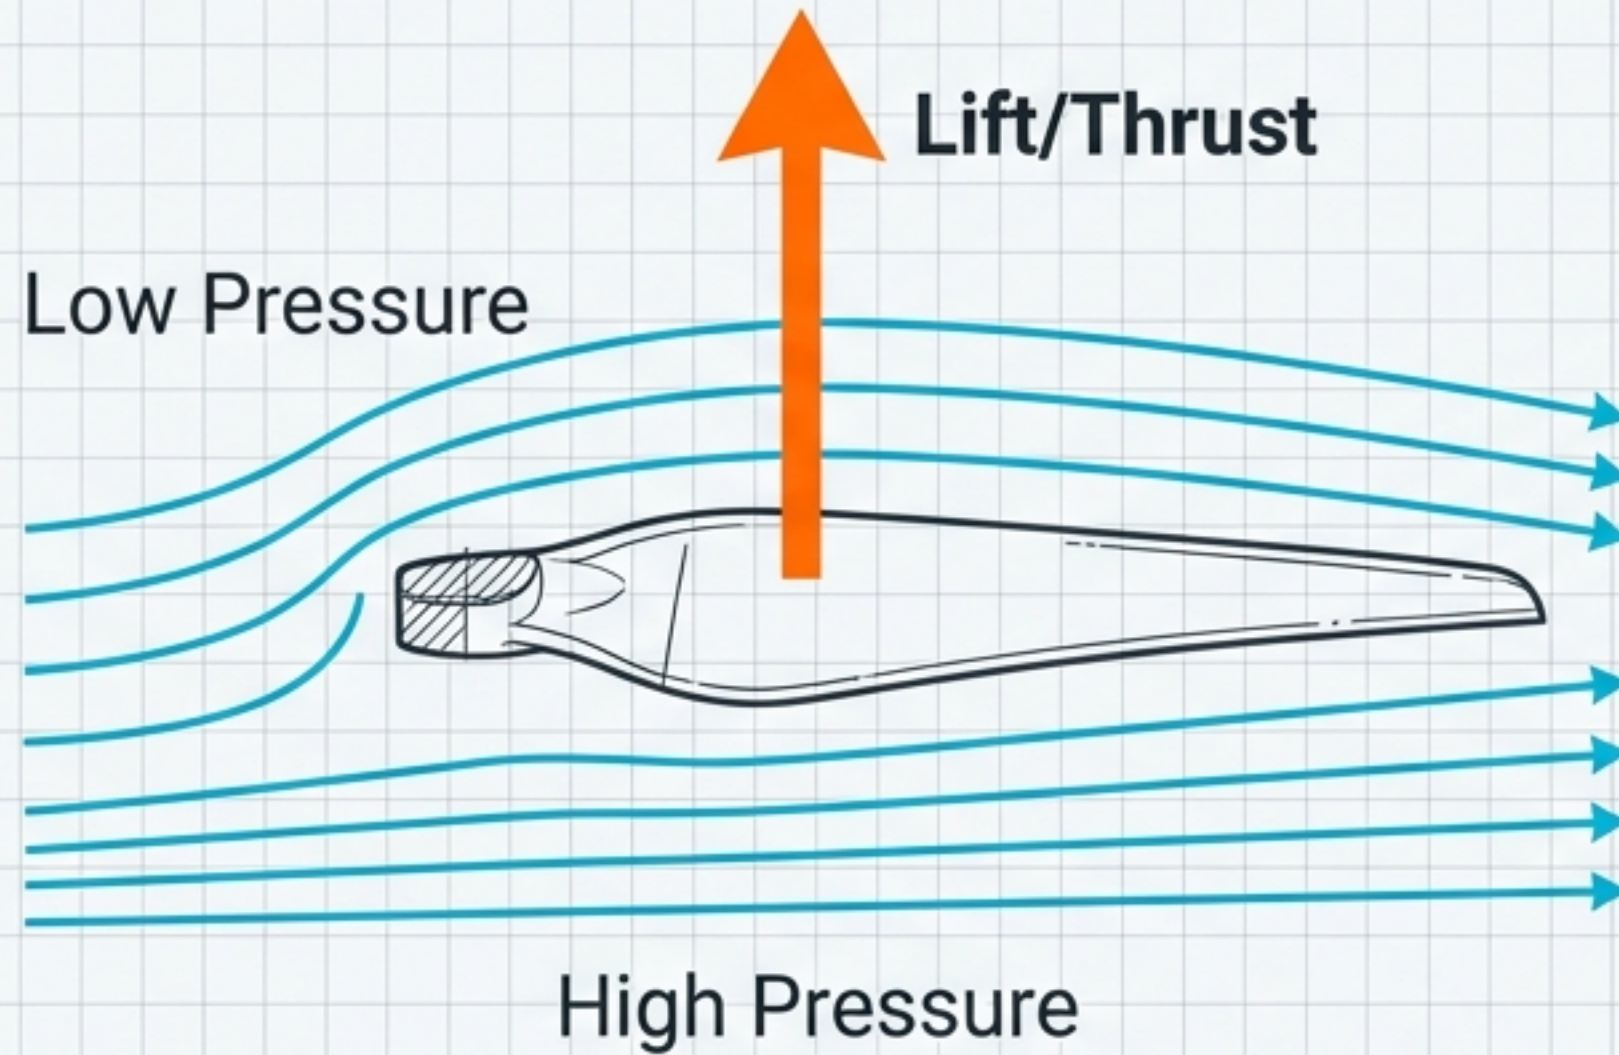

Switching power 50,000 times a second to create a rotating magnetic field.

The Muscle II: Brushless Motors.

Interaction: Aerodynamics

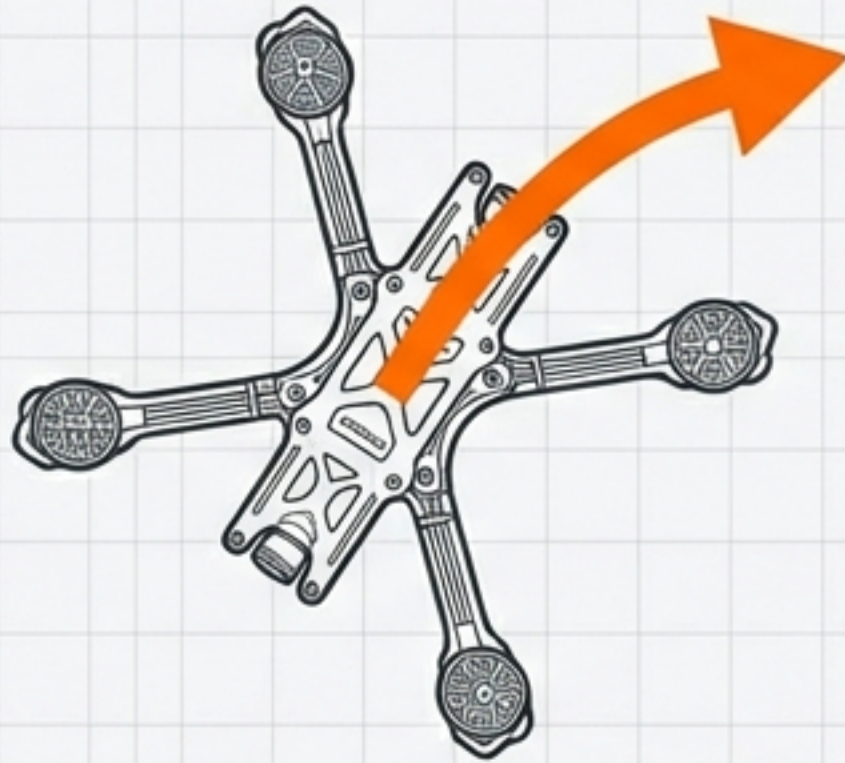

Torque Cancellation.
Opposing spins neutralize Yaw.

Unbalanced props create vibration, the enemy of the IMU

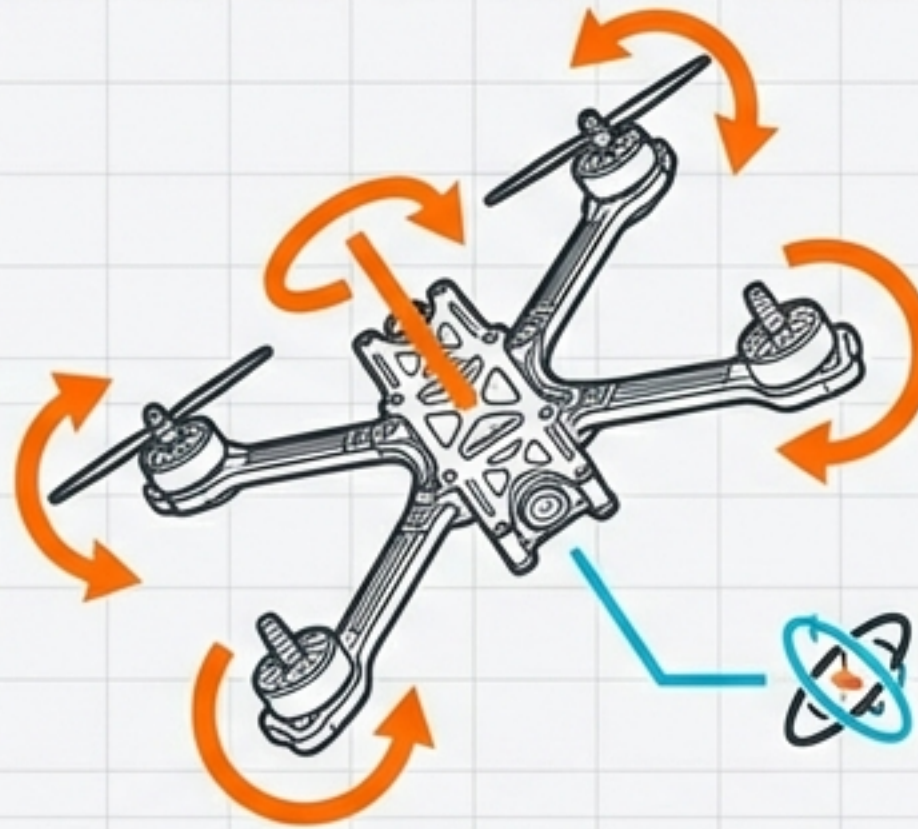

The Result: Flight Modes.

Angle Mode (Self-Level).

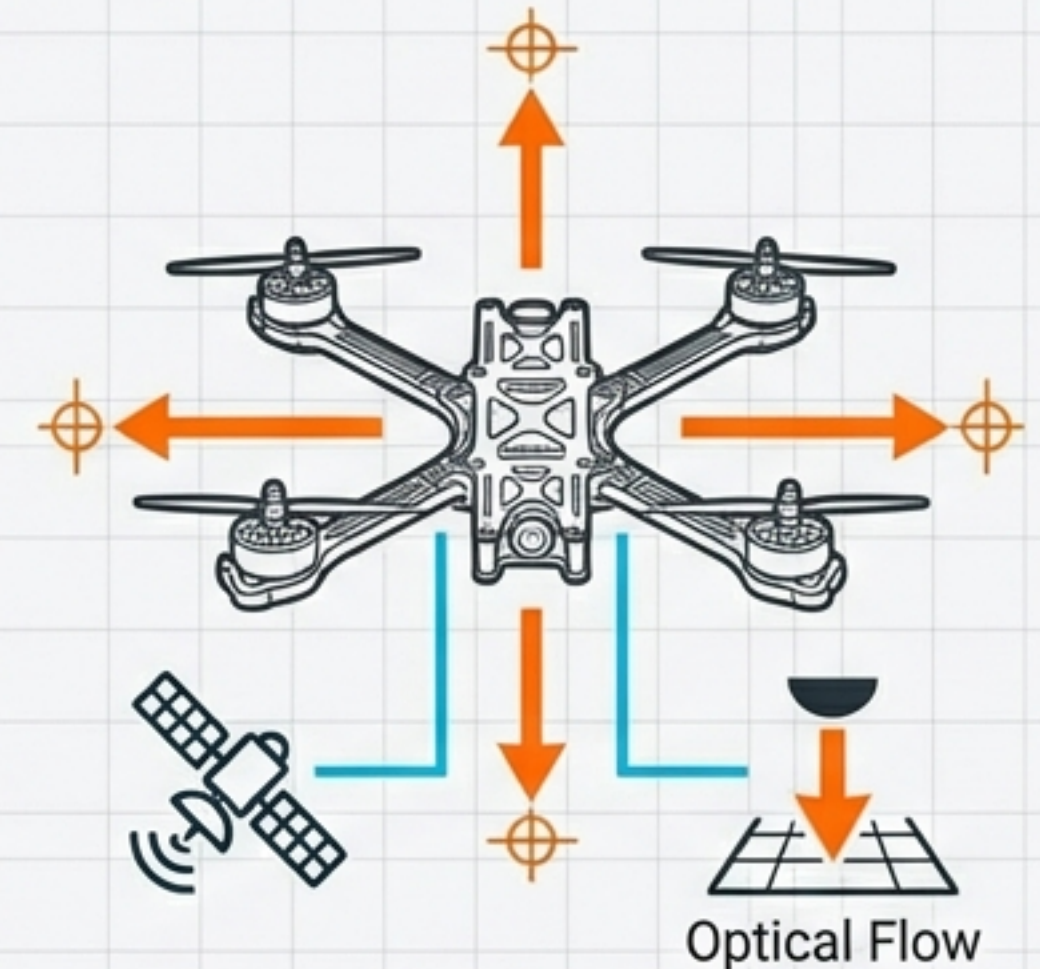

Stick = Desired Angle.
Accelerometer Dominant.

Acro Mode (Rate).

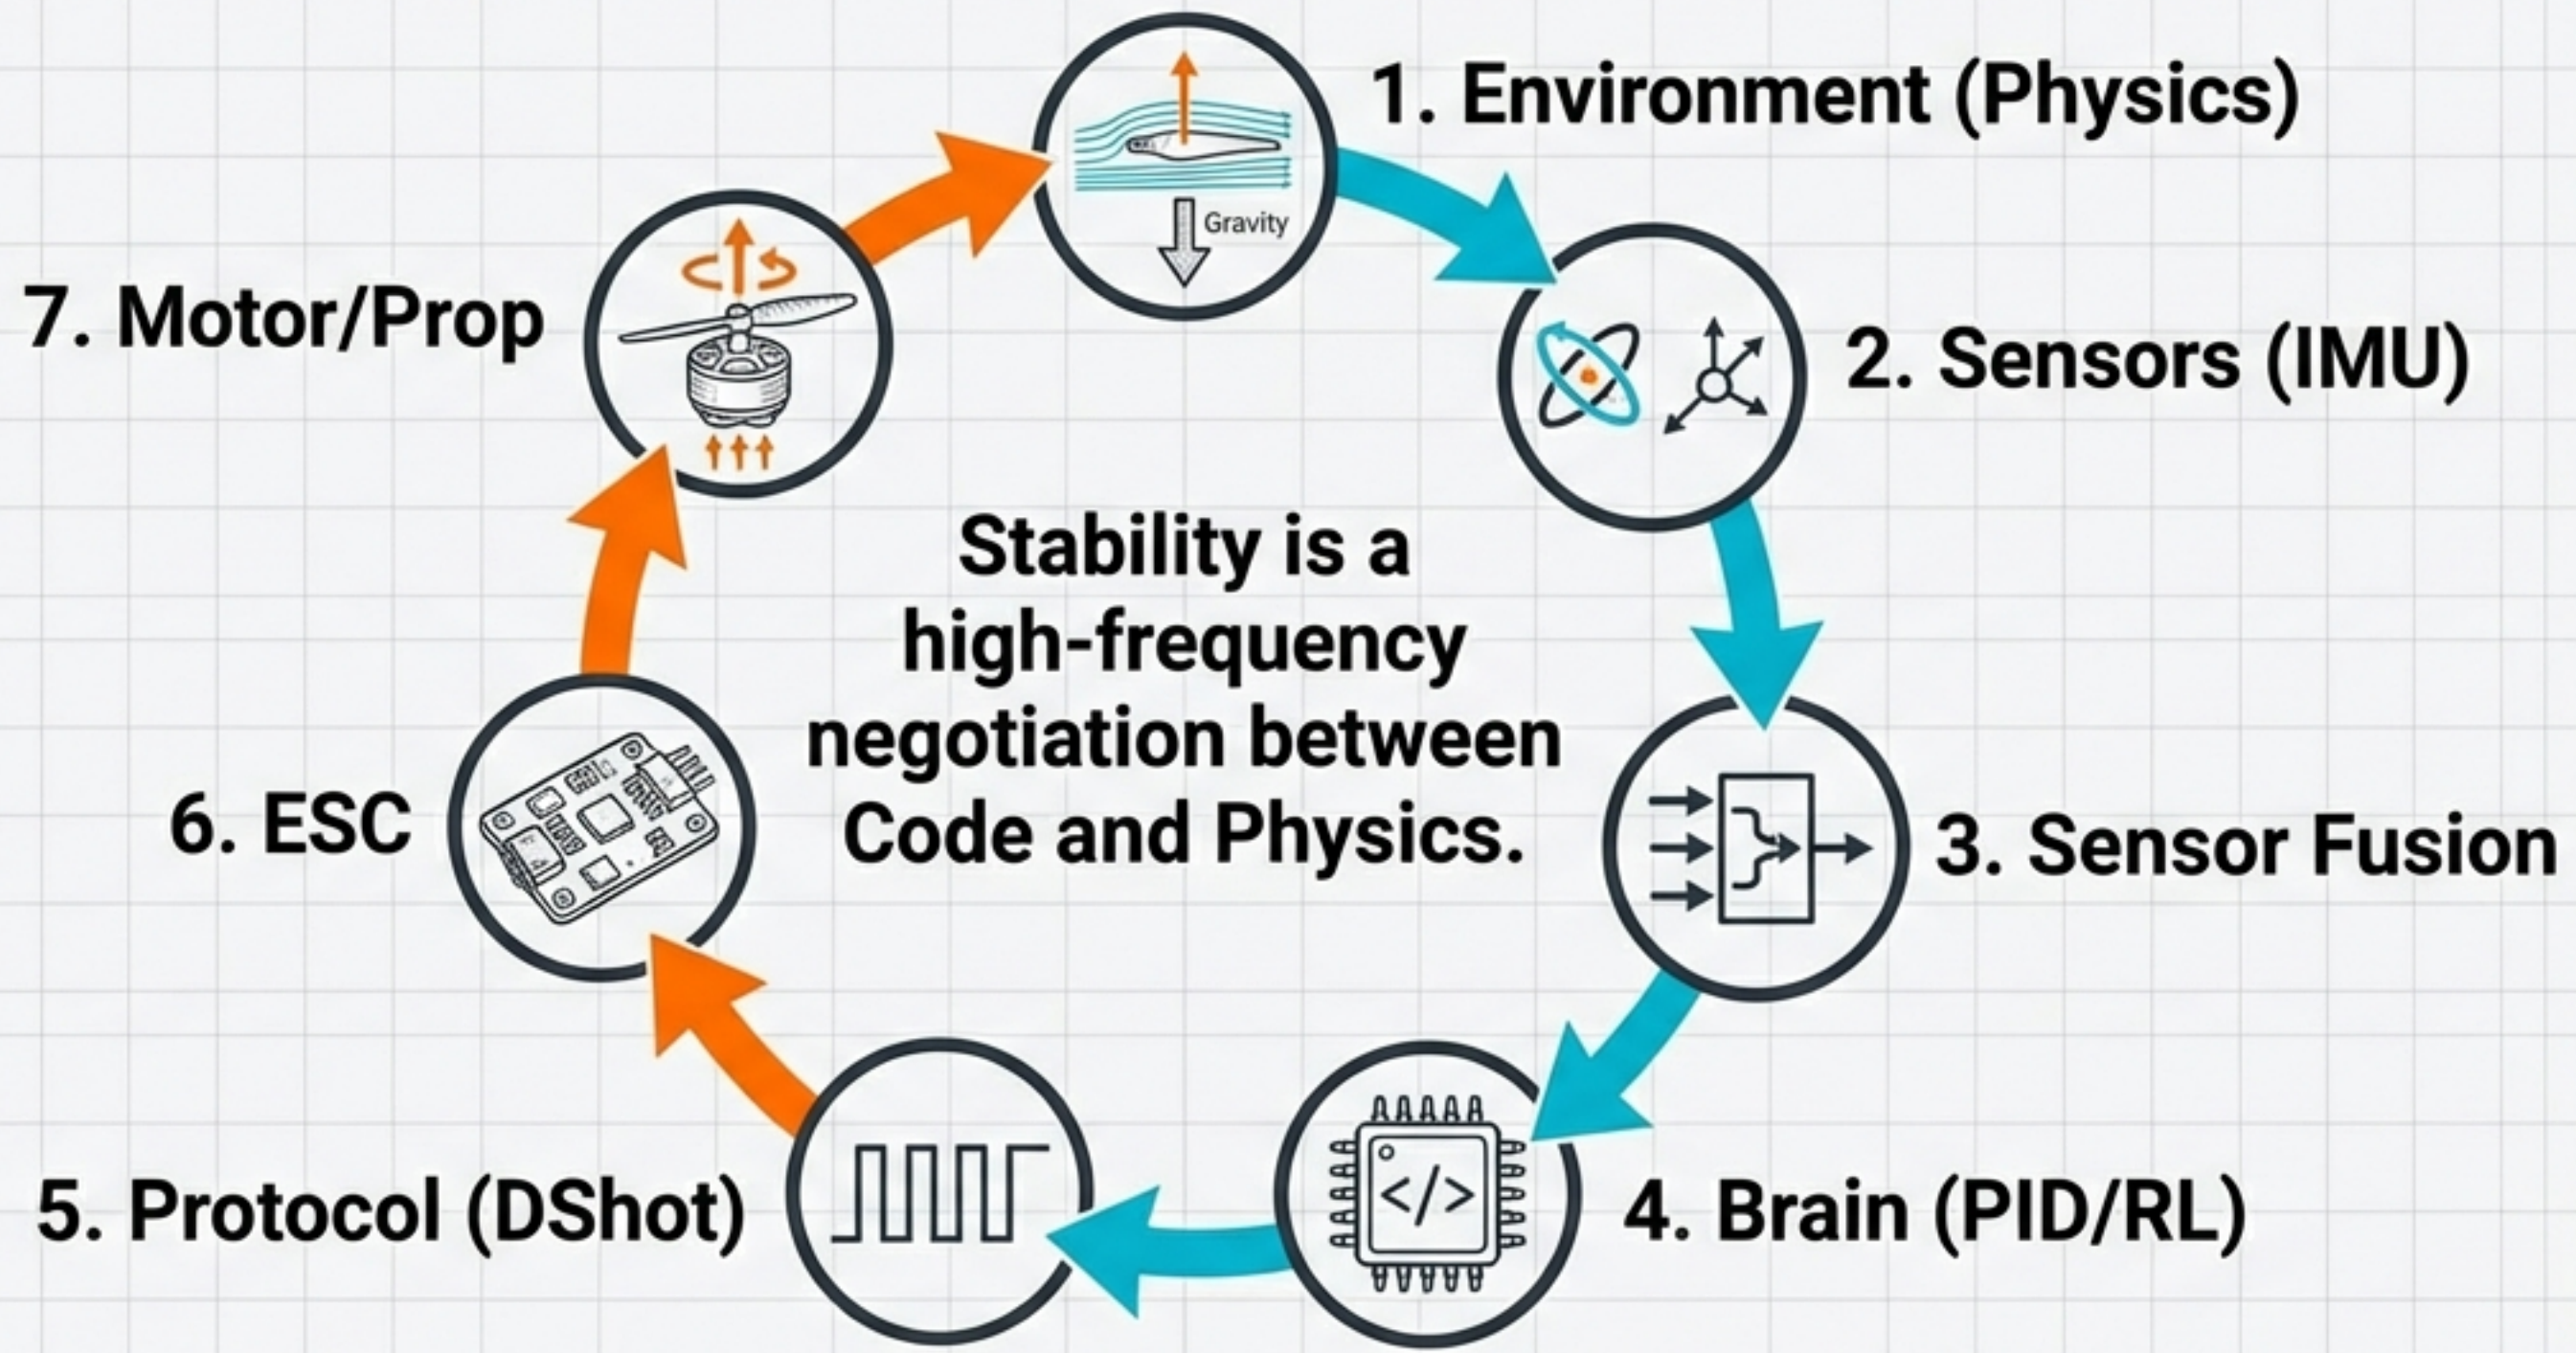

Stick = Rotation Speed.
Gyroscope Dominant.
No Limits.

Position Hold.

Stick = Velocity.
GPS + Optical Flow.

Summary: The Digital Organism.

Future Outlook: Adaptive AI agents and bi-directional digital feedback.
